
CMOS Single Chip 8-bit MCU with 12-bit ADC
General Purpose Microcontroller

Datasheet Version 1.08

Features

Core

- 8-bit CISC M8051 core
(8051 Compatible, 2 clocks per cycle)

2 Kbytes On-Chip FLASH

- Endurance : 30,000 times
- In-System Programming (ISP)
- Retention : 10 years

256 bytes IRAM

General Purpose I/O (GPIO)

- Normal I/O : 8 ports
(P0[3:0], P1[7:6], P2[1:0])

Timer/Counter

- Basic Interval Timer (BIT) 8-bit × 1-ch
- Watch Dog Timer (WDT) 8-bit × 1-ch
- 8-bit × 1-ch (T0)
- 16-bit × 2-ch (T1/T2)

Programmable Pulse Generation

- 16-bit Pulse generation (by T1/T2)
- 8-bit PWM (by T0)
- 16-bit Complementary PWM (by T1)

12-bit A/D Converter

- 8 Input channels

Power On Reset

- Reset release level (1.32V)

Low Voltage Reset

- 5 levels detect
(1.61 / 1.77 / 2.13 / 2.46 / 3.56V)

Low Voltage Indicator

- 4 levels detect
(1.77 / 2.13 / 2.46 / 3.56V)

Interrupt Sources

- EINT(0/1/2) (3)
- PCI (1)
- Timer(0/1/2) (3)
- WDT (1)
- BIT (1)
- ADC (1)
- LVI (1)

Internal RC Oscillator

- HSI 32MHz ±1.5% (TA=0~ +50°C)
- HSI 32MHz ±2.0% (TA=-10~ +70°C)
- HSI 32MHz ±2.5% (TA=-40~ +85°C)
- HSI 32MHz ±5.0% (TA=-40~ +105°C)
- LSI 128kHz ±20% (TA= -40~ +85°C)
- LSI 128kHz ±30% (TA= -40~ +105°C)

Power Down Mode

- STOP, IDLE mode

Operating Voltage and Frequency

- 1.8V~ 5.5V (@0.5 ~ 16.0MHz with Internal RC)

Minimum Instruction Execution Time

- 125ns (@16MHz main clock)

Operating temperature

- -40 ~ +85°C, -40 ~ +105°C

Package Type

- 10 SSOP
- 8SOP
- Pb-free package

A96G181

1 Description

A96G181 is an advanced CMOS 8-bit microcontroller with 2K bytes of FLASH. This product has following features :

2K bytes of FLASH, 256 bytes of SRAM, General purpose I/O, 8/16-bit Timer, Window Watchdog timer, POR and LVI, LVR, on-chip oscillator, 12-bit A/D converter, 8/16-bit PWM output, and clock circuitry.

In addition, a number of advantages such as its low voltage operating range from 1.8~5.5V, wide operating temperature range(-40~85/105°C) and low current consumption characteristics will be helpful in various battery operation applications. This is a powerful microcontroller that provides a highly flexible and cost-effective solution for a wide range of applications such as electric shaver, LED lighting, battery charger, battery protection circuit, wireless vacuum cleaner, home automation system, IoT & sensor applications, etc.

1.1 Device overview

In this section, features of A96G181 and peripheral counts are introduced.

Table 2. A96G181 Device Features and Peripheral Counts

Peripherals		Description
Core	CPU	8-bit CISC core (M8051, 2 clocks per cycle)
	Interrupt	Up to 11 peripheral interrupts supported. <ul style="list-style-type: none"> • EINT0 to 2 (3) • PCI (1) • Timer (0/1/2) (3) • WDT (1) • BIT (1) • ADC (1) • LVI (1)
Memory	ROM (FLASH) capacity	<ul style="list-style-type: none"> • 2Kbytes FLASH with self-read and write capability • In-system programming (ISP) • Endurance: 30,000times • Retention : 10 years

2.2 Pin description

Table 3. Normal Pin Description

Pin no.			PIN Name	I/O ⁽²⁾	Description	Remark
10SSOP	8SOP	-				
2	2	-	P00*	IOUS	Port 0 bit 0 Input/output	
			AN3	IA	ADC input ch-3	
			EC0	I	Timer 0(External Clock) input	
			DSDA	IO	OCD debugger data input/output	Pull-up
3	3	-	P01*	IOUS	Port 0 bit 1 Input/output	
			AN4	IA	ADC input ch-4	
			DSCL	I	OCD debugger clock	Pull-up
4	4	-	P02*	IOUS	Port 0 bit 2 Input/output	
			RESETB	IU	Reset pin	Pull-up
			EINT0	I	External interrupt input ch-0	
			AN6	IA	ADC input ch-6	
5	-	-	P03*	IOUS	Port 0 bit 3 Input/output	
			AN5	IA	ADC input ch-5	
			T0O	O	Timer 0 interval output	
			PWM0O	O	Timer 0 PWM output	
6	5	-	P16*	IOUS	Port 1 bit 6 Input/output	
			AN14	IA	ADC input ch-14	
			EINT1	I	External interrupt input ch-1	
			EC1	I	Timer 1(External Clock) input	
			T2O	O	Timer 2 interval output	
			PWM2O	O	Timer 2 PWM output	
7	6	-	P17*	IOUS	Port 1 bit 7 Input/output	
			AN0	IA	ADC input ch-0	
			EINT2	I	External interrupt input ch-2	
			PWM1OB	O	Timer 1 PWM complementary output	
			T2O	O	Timer 2 interval output	
			PWM2O	O	Timer 2 PWM output	
8	7	-	P20*	IOUS	Port 2 bit 0 Input/output	
			AN1	IA	ADC input ch-1	
			T1O	O	Timer 1 interval output	
			PWM1O	O	Timer 1 PWM output	

Table 3. Normal Pin Description (continued)

Pin no.			PIN Name	I/O ⁽²⁾	Description	Remark
10SSOP	8SOP	-				
9	-	-	P21*	IOUS	Port 2 bit 1 Input/output	
			AN2	IA	ADC input ch-2	
			T0O	O	Timer 0 interval output	
			PWM0O	O	Timer 0 PWM output	
1	1	-	VDD	P	VDD	
10	8	-	VSS	P	VSS	

NOTE:

- The ⁽²⁾ means I=Input, O=Output, U=Pull-up, D=Pull-down, S=Schmitt-Trigger Input Type, C=CMOS Input Type, A=Analog, P=Power
- The * means 'Selected pin function after reset condition

3 Port structures

In this chapter, two port structures are introduced in Figure 4 & Figure 5 regarding general purpose I/O port and external interrupt I/O port respectively.

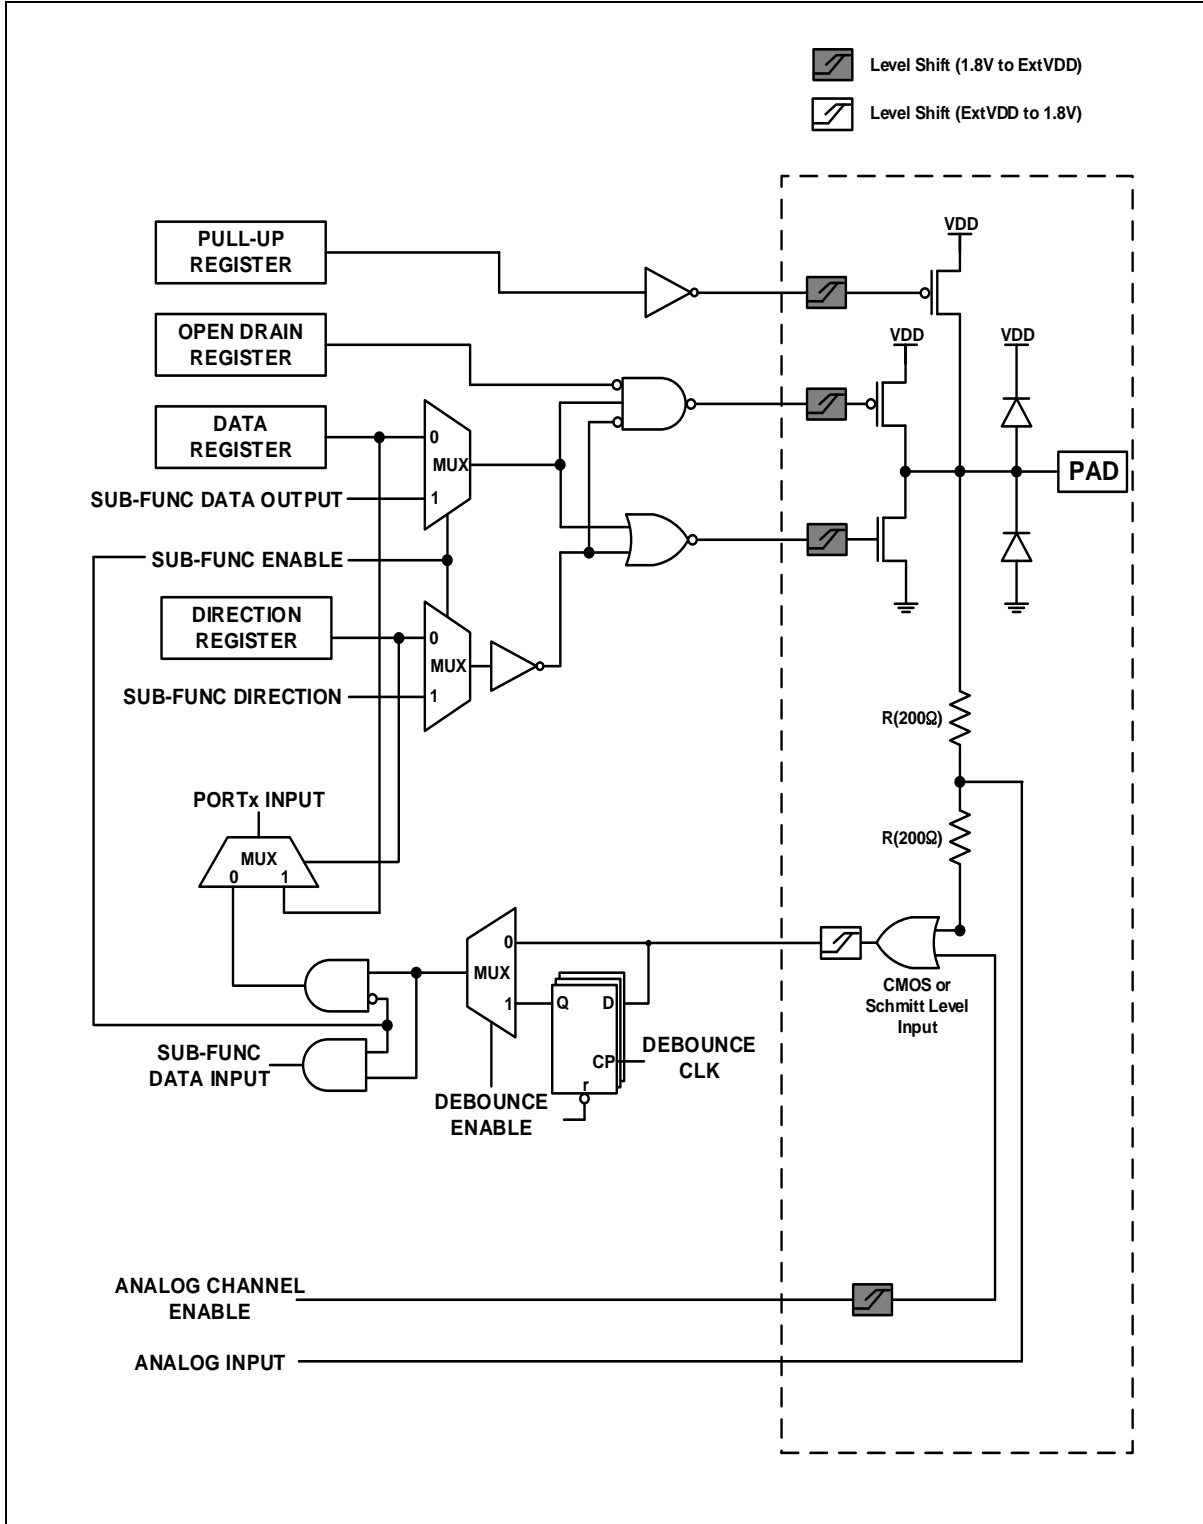

Figure 4. General Purpose I/O Port

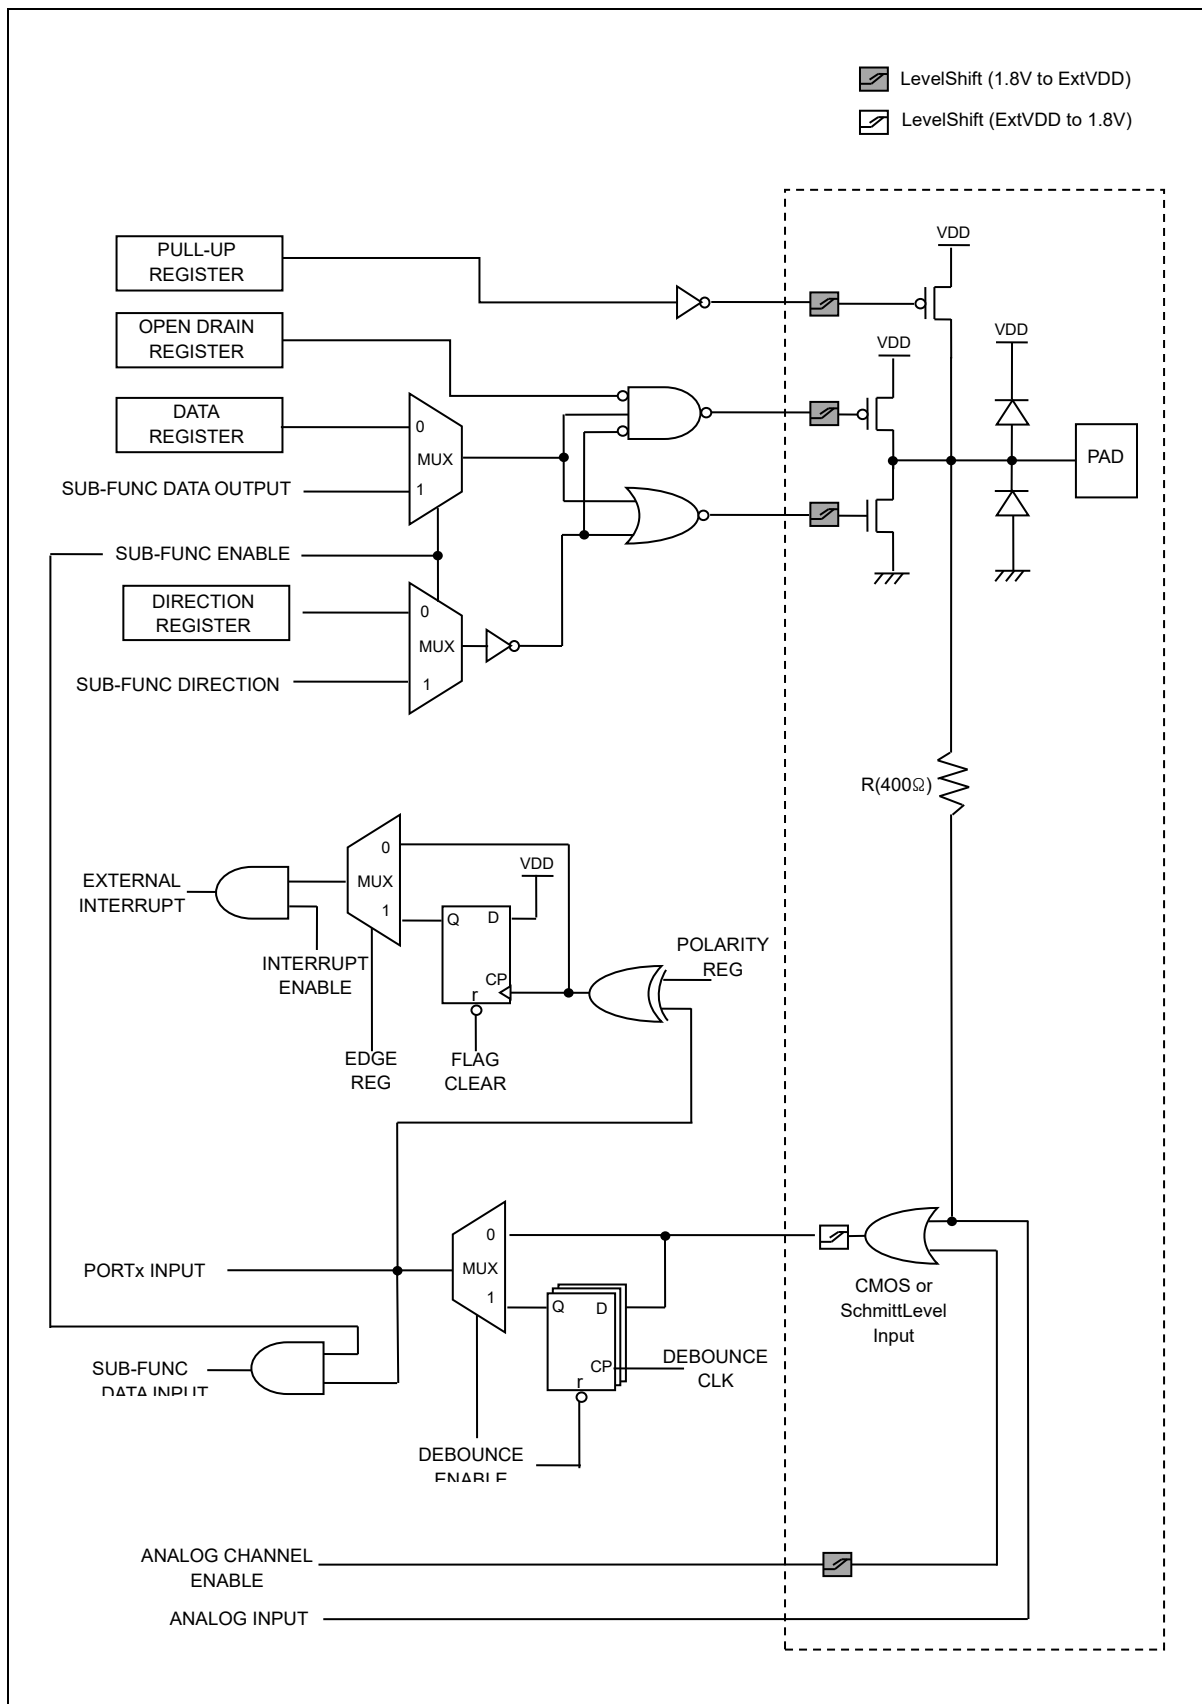

Figure 5. External Interrupt I/O Port

4 Central Processing Unit(CPU)

Central Processing Unit (CPU) of A96G181 is based on Mentor Graphics M8051EW core, which offers improved code efficiency and high performance.

4.1 Architecture and registers

Figure 6 shows a block diagram of the M8051EW architecture. As shown in the figure, the M8051EW supports both Program Memory and External Data Memory. In addition, it features a Debug Mode in which it can be driven through a dedicated debug interface.

Figure 6 M8051EW Architecture

Main features of the M8051EW are listed below:

- Two clocks per machine cycle architecture:
- Debug support (OCD and OCD II):
- Separate program and external data memory interfaces or a single multiplexed interface
- Support for synchronous and asynchronous Program, External Data and Internal Data Memory
- Wait states support for slow Program and External Data Memory

- 16-bit Data Memory address is generated through the Data Pointer register(DPTR register).
- 16-bit program counter is capable of addressing up to Flash size in Each device
- A single data pointer, two memory-mapped data pointers, or 2 banked data pointers
- Support for 2 or 4 level of priority scheme – Up to 24 maskable Interrupt sources
- External Special Function Register (SFR) are memory mapped into Direct Memory at the addresses between 80 hex and FF hex

4.2 Addressing

The M8051EW supports six types of addressing modes as listed below:

1. Direct addressing mode: In this mode, the operand is specified by the 8-bit address field. Only internal data and SFRs can be accessed using this mode.
2. Indirect addressing mode: In this mode, the operand is specified by addresses contained in a register. Two registers (R0 and R1) from the current bank or the Data Pointer may be used for addressing in this mode. Both internal and external Data Memory may be indirectly addressed.
3. Register addressing mode: In this mode, the operand is specified by the top 3 bits of the opcode, which selects one of the current bank of registers. Four banks of registers are available. The current bank is selected by the 3rd and 4th bits of the PSW.
4. Register specific addressing mode: In this mode, some instructions only operate on specific registers. This is defined by the opcode. In particular many accumulator operations and some stack pointer operations are defined in this manner.
5. Immediate DATA mode: In this mode, Instructions which use Immediate Data are 2 or more bytes long and the Immediate operand is stored in Program Memory as part of the instruction.

Example) MOV A, #100

 It loads the Accumulator with the decimal number 100. The same number could be specified in hex digits as 64H.

6. Indexed addressing mode: In this mode, only Program Memory can be addressed. It is intended for simple implementation of look-up tables. A 16-bit base register (either the PC or the DPTR) is combined with an offset stored in the accumulator to access data in Program Memory.

4.3 Instruction set

An instruction is a single operation of a processor that is defined by the instruction set. The M8051EW uses the instruction set of 8051 that is broadly classified into five functional categories:

1. Arithmetic instructions
2. Logical instructions
3. Data transfer instructions
4. Boolean instructions
5. Branching instructions

Major features of the instruction set are listed below. If you need detailed information about the instruction table, please refer to **Appendix** or **Instruction table**:

- Instructions are either 1, 2 or 3 bytes long as listed in the 'Bytes'.
- Each instruction takes either 1, 2 or 4 machine cycles to execute. 1 machine cycle comprises 2 CCLK clock cycles.
- An M8051EW-specific instruction "MOVC @ (DPTR++), A" is provided to enable software to be downloaded into Program Memory where it is implemented as RAM. This instruction can also be used subsequently to modify contents of the Program Memory RAM.
- Arithmetic Instruction
- Logical Instruction
- Internal data memory
- External data memory
- Unconditional Jumps
- Subroutine calls and returns
- Conditional Jumps
- Boolean Instructions
- Flag

5 Memory organization

A96G181 addresses two separate memory spaces:

- Program memory
- Data memory

By means of this logical separation of the memory, 8-bit CPU address can access the Data Memory more rapidly. 16-bit Data Memory address is generated through the DPTR register.

A96G181 provides on-chip 2Kbytes of the ISP type flash program memory, which readable and writable. Internal data memory (IRAM) is 256bytes and it includes the stack area.

5.1 Program memory

A 16-bit program counter is capable of addressing up to 64Kbytes, and A96G181 has just 2Kbytes program memory space.

Figure 7 shows a map of the lower part of the program memory.

After reset, CPU begins execution from location 0000H. Each interrupt is assigned a fixed location in the program memory. An interrupt causes the CPU to jump to the corresponding location, where it commences execution of the service routine.

An external interrupt 11, for example, is assigned to location 000BH. If the external interrupt 11 is going to be used, its service routine must begin at location 000BH. If the interrupt is not going to be used, its service location is available as general purpose program memory. If an interrupt service routine is short enough (as is often the case in control applications), it can reside entirely within an interval of 8-bytes.

Longer service routines can use a jump instruction to skip over subsequent interrupt locations, if other interrupts are in use.

Figure 7. Program Memory Map

5.2 Data memory

Internal data memory space is divided into three blocks, which are generally referred to as lower 128bytes, upper 128bytes, and SFR space. Internal data memory addresses are always one byte wide, which implies an address space of 256bytes. In fact, the addressing modes for the internal data memory can accommodate up to 384bytes by using a simple trick. Direct addresses higher than 7FH access one memory space, while indirect addresses higher than 7FH access a different memory space. Thus as shown in Figure 8, the upper 128bytes and SFR space occupy the same block of addresses, 80H through FFH, although they are physically separate entities.

The lower 128bytes of RAM are present in all 8051 devices as mapped in Figure 9. The lowest 32bytes are grouped into 4 banks of 8 registers. Program instructions call out these registers as R0 through R7. Two bits in the Program Status Word select which register bank is in use. This allows more efficient use of code space, since register instructions are shorter than instructions that use direct addressing.

The next 16bytes above the register banks form a block of bit-addressable memory space. The 8051 instruction set includes a wide selection of single-bit instructions, and the 128 bits in this area can be directly addressed by these instructions. The bit addresses in this area are 00H through 7FH.

All of the bytes in the lower 128bytes can be accessed by either direct or indirect addressing. The upper 128bytes of RAM can only be accessed by indirect addressing. These spaces are used for data RAM and stack.

6 I/O ports

A96G181 has 3 groups of I/O ports (P0 ~ P2). Each port can be easily configured by software as I/O pin, internal pull up and open-drain pin to meet various system configurations and design requirements. P0 includes a function that can generate interrupt signals according to state of a pin.

6.1 P0 port

6.1.1 P0 port description

P0 is an 8-bit I/O port. P0 control registers consist of P0 data register (P0), P0 direction register (P0IO), debounce enable register (P0DB), P0 pull-up resistor selection register (P0PU), and P0 open-drain selection register (P0OD). Refer to the port function selection registers for the P0 function selection.

6.2 P1 port

6.2.1 P1 port description

P1 is an 8-bit I/O port. P1 control registers consist of P1 data register (P1), P1 direction register (P1IO), debounce enable register (P1DB), P1 pull-up resistor selection register (P1PU), and P1 open-drain selection register (P1OD). Refer to the port function selection registers for the P1 function selection.

6.3 P2 port

6.3.1 P2 port description

P2 is an 8-bit I/O port. P2 control registers consist of P2 data register (P2), P2 direction register (P2IO), P2 pull-up resistor selection register (P2PU) and P2 open-drain selection register (P2OD). Refer to the port function selection registers for the P2 function selection.

7 Interrupt controller

A96G181 supports up to 11 interrupt sources. The interrupts have separate enable register bits associated with them, allowing software control. In addition, they have four levels of priority assigned to themselves.

A non-maskable interrupt source is always enabled with a higher priority than any other interrupt sources, and is not controllable by software.

Interrupt controller of A96G181 has following features:

- Request receive from the 11 interrupt sources
- 6 groups of priority
- 4 levels of priority
- Multi Interrupt possibility
- A request of higher priority level is served first, when multiple requests of different priority levels are received simultaneously.
- Each interrupt source can be controlled by EA bit and each IEx bit
- Interrupt latency of 3 to 9 machine cycles in single interrupt system

A non-maskable interrupt is always enabled, while maskable interrupts are enabled through three pairs of interrupt enable registers (IE, IE1, and IE2). Each bit of IE, IE1, IE2 register individually enables/disables the corresponding interrupt source. Overall control is provided by bit 7 of IE (EA). When EA is set to '0', all interrupts are disabled: when EA is set to '1', interrupts are individually enabled or disabled through the other bits of the interrupt enable registers. The EA bit is always cleared to '0' jumping to an interrupt service vector and set to '1' executing the [RETI] instruction. The A96G181 supports a four-level priority scheme. Each maskable interrupt is individually assigned to one of four priority levels according to IP and IP1.

Default interrupt mode is level-trigger mode basically, but if needed, it is possible to change to edge-trigger mode. Figure 10 shows the Interrupt Group Priority Level that is available for sharing interrupt priority. Priority of a group is set by two bits of interrupt priority registers (one bit from IP, another one from IP1). Interrupt service routine serves higher priority interrupt first. If two requests of different priority levels are received simultaneously, the request of higher priority level is served prior to the lower one.

Interrupt Group	Highest →				Lowest
	Interrupt 0	Interrupt 6	Interrupt 12	Interrupt 18	
0 (Bit0)	Interrupt 0	Interrupt 6	Interrupt 12	Interrupt 18	Highest ↓ Lowest
1 (Bit1)	Interrupt 1	Interrupt 7	Interrupt 13	Interrupt 19	
2 (Bit2)	Interrupt 2	Interrupt 8	Interrupt 14	Interrupt 20	
3 (Bit3)	Interrupt 3	Interrupt 9	Interrupt 15	Interrupt 21	
4 (Bit4)	Interrupt 4	Interrupt 10	Interrupt 16	Interrupt 22	
5 (Bit5)	Interrupt 5	Interrupt 11	Interrupt 17	Interrupt 23	

Figure 10. Interrupt Group Priority Level

7.1 Block diagram

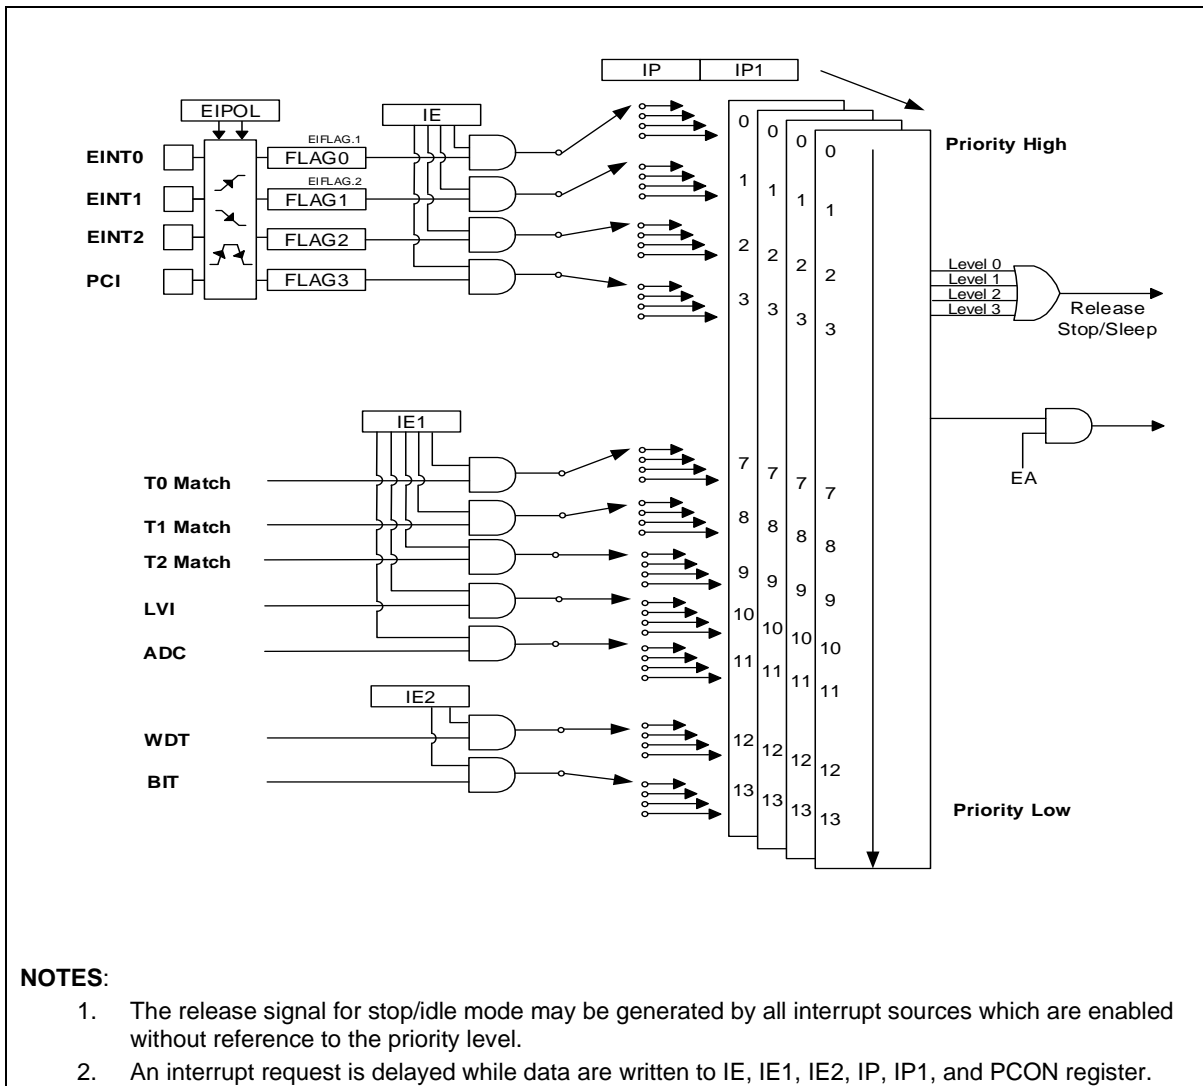

Figure 11. Interrupt Controller Block Diagram

7.2 Interrupt vector table

Interrupt controller of A96G181 supports 11 interrupt sources as shown in Table 8. When interrupt is served, long call instruction (LCALL) is executed and program counter jumps to the vector address. All interrupt requests have their own priority order.

Table 8. Interrupt Vector Address Table

Interrupt source	Symbol	Interrupt enable bit	Priority	Mask	Vector address
Hardware Reset	RESETB	-	0	Non-Maskable	0000H
External Interrupt 0	INT0	IE.0	1	Maskable	0003H
External Interrupt 1	INT1	IE.1	2	Maskable	000BH
External Interrupt 2	INT2	IE.2	3	Maskable	0013H
PCI Interrupt	INT3	IE.3	4	Maskable	001BH
Reserved	INT4	IE.4	5	Maskable	0023H
Reserved	INT5	IE.5	6	Maskable	002BH
Reserved	INT6	IE1.0	7	Maskable	0033H
T0 Match Interrupt	INT7	IE1.1	8	Maskable	003BH
T1 Match Interrupt	INT8	IE1.2	9	Maskable	0043H
T2 Match Interrupt	INT9	IE1.3	10	Maskable	004BH
LVI Interrupt	INT10	IE1.4	11	Maskable	0053H
ADC Interrupt	INT11	IE1.5	12	Maskable	005BH
WDT Interrupt	INT12	IE2.0	13	Maskable	0063H
BIT Interrupt	INT13	IE2.1	14	Maskable	006BH

For maskable interrupt execution, EA bit must set '1' and specific interrupt must be enabled by writing '1' to associated bit in the IEx. If an interrupt request is received, the specific interrupt request flag is set to '1'. And it remains '1' until CPU accepts interrupt. If the interrupt is served, the interrupt request flag will be cleared automatically.

8 Clock generator

As shown in Figure 12, a clock generator produces basic clock pulses which provide a system clock for CPU and peripheral hardware.

Default system clock is 16MHz INT-RC Oscillator. To stabilize the system internally, 128kHz LOW INT-RC oscillator on POR is recommended.

Oscillators in the clock generator are introduced in the followings:

- Calibrated high internal RC oscillator (32MHz)
 - HSIRC OSC/2 (16MHz, default system clock)
 - HSIRC OSC/4 (8MHz)
 - HSIRC OSC/8 (4MHz)
 - HSIRC OSC/16 (2MHz)
 - HSIRC OSC/32 (1MHz)
 - HSIRC OSC/64 (0.5MHz)
- Internal LSIRC oscillator (128kHz)

8.1 Clock generator block diagram

In this section, a clock generator of A96G181 is described in a block diagram.

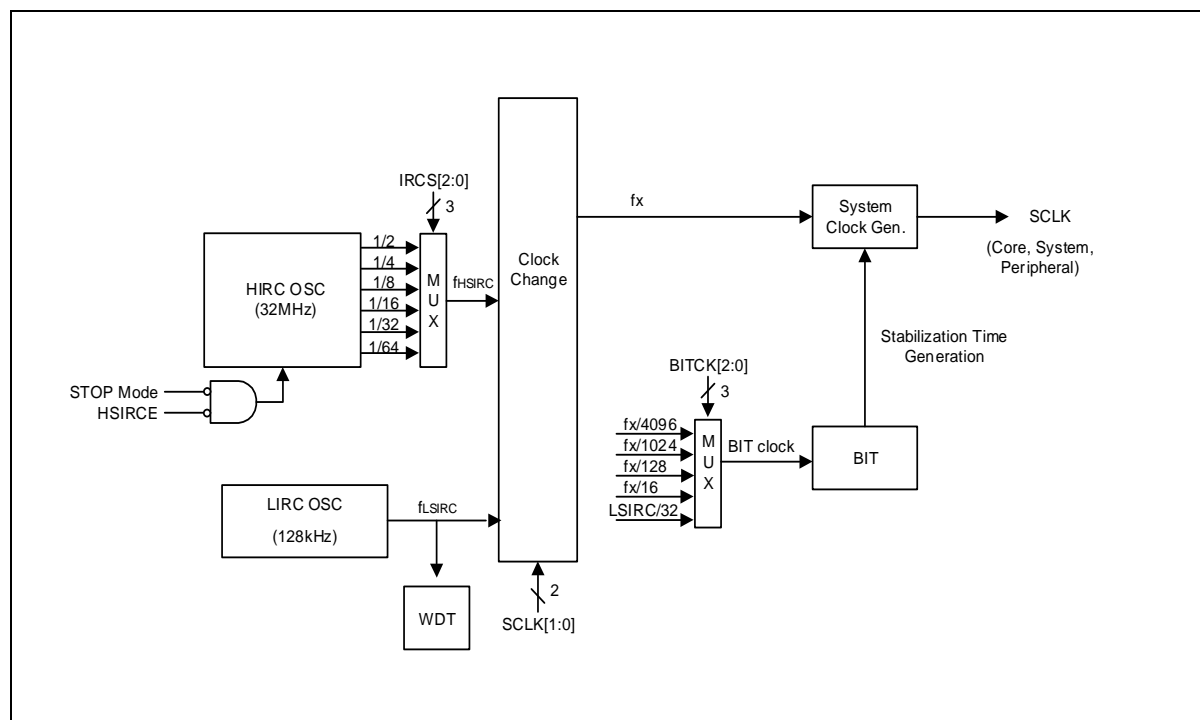

Figure 12. Clock Generator Block Diagram

9 Basic interval timer

A96G181 has a free running 8-bit Basic Interval Timer (BIT). BIT generates the time base for watchdog timer counting, and provides a basic interval timer interrupt (BITIFR).

BIT of A96G181 features the followings:

- During Power On, BIT gives a stable clock generation time
- On exiting Stop mode, BIT gives a stable clock generation time
- As a timer, BIT generates a timer interrupt.

9.1 BIT block diagram

In this section, basic interval timer of A96G181 is described in a block diagram.

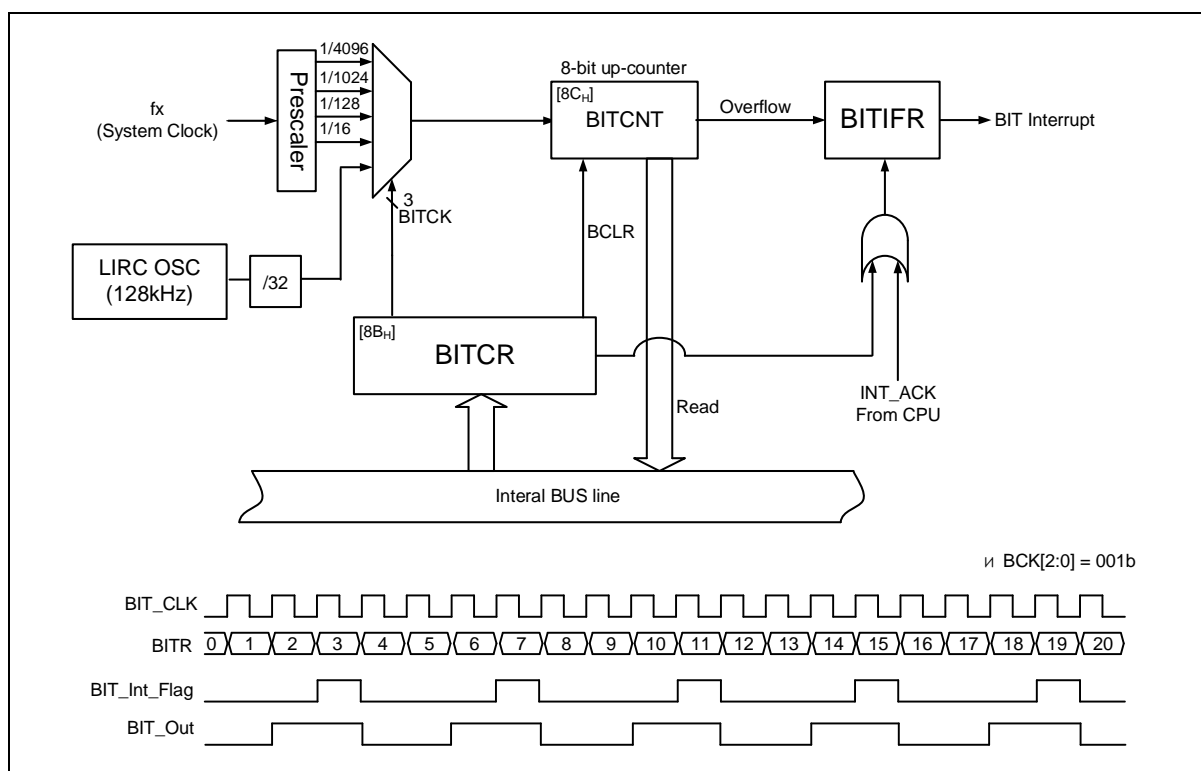

Figure 13. Basic Interval Timer Block Diagram

10 Watchdog timer

The watchdog timer rapidly detects the CPU malfunction such as endless looping caused by noise or something like that, and resumes the CPU to the normal state. The watchdog timer signal for malfunction detection can be used as either a CPU reset or an interrupt request. When the watchdog timer is not being used for malfunction detection, it can be used as a timer to generate an interrupt at fixed intervals. When 75% of the overflow time is reached, a watchdog interrupt can be generated. The overflow time of the watchdog timer can select by WDOVF[2:0] of WDTCR. If an overflow occurs, an internal reset is generated. The WDTRC operation in the STOP/IDLE mode differs as follows depending on the setting value of WDTDPON. If WDTDPON = 0, the WDTRC operation stop in the STOP/IDLE mode and if WDTDPON = 1, the WDTRC operation in the STOP/IDLE mode. The watchdog timer operate on the 4kHz, based on clock 128kHz Ring oscillator clock.

Watchdog reset is occurred in the following cases:

- When the watchdog timer counter overflows
- When the data except “96H” is written to the WDTC register
- When the data “96H” is written to the WDTC register during a window close period

10.1 WDT block diagram

Figure 14. Watch Dog Timer Block Diagram

11 Timer 0/1/2

11.1 Timer 0

An 8-bit timer 0 consists of a multiplexer, a timer 0 counter register, a timer 0 data register, a timer 0 capture data register and a timer 0 control register (T0CNT, T0DR, T0CDR, T0CR).

Timer 0 operates in one of three modes introduced in the followings:

- 8-bit timer/counter mode
- 8-bit PWM output mode
- 8-bit capture mode

Timer/counter 0 can be clocked by an internal or an external clock source (EC0). The clock source is selected by clock selection logic which is controlled by clock selection bits T0CK[2:0].

- TIMER0 clock source: $f_x/2$, 4, 8, 32, 128, 512, 2048 and EC0

In capture mode, data is captured into input capture data register (T0CDR) by EINT0. In timer/counter mode, whenever counter value is equal to T0DR, T0O port toggles. In addition, timer 0 outputs PWM waveform through PWM0O port in the PWM mode.

Table 9. Timer 0 Operating Mode

T0EN	T0MS[1:0]	T0CK[2:0]	Timer 0
1	00	XXX	8-bit Timer/Counter Mode
1	01	XXX	8-bit PWM Mode
1	1X	XXX	8-bit Capture Mode

11.1.1 Timer 0 block diagram

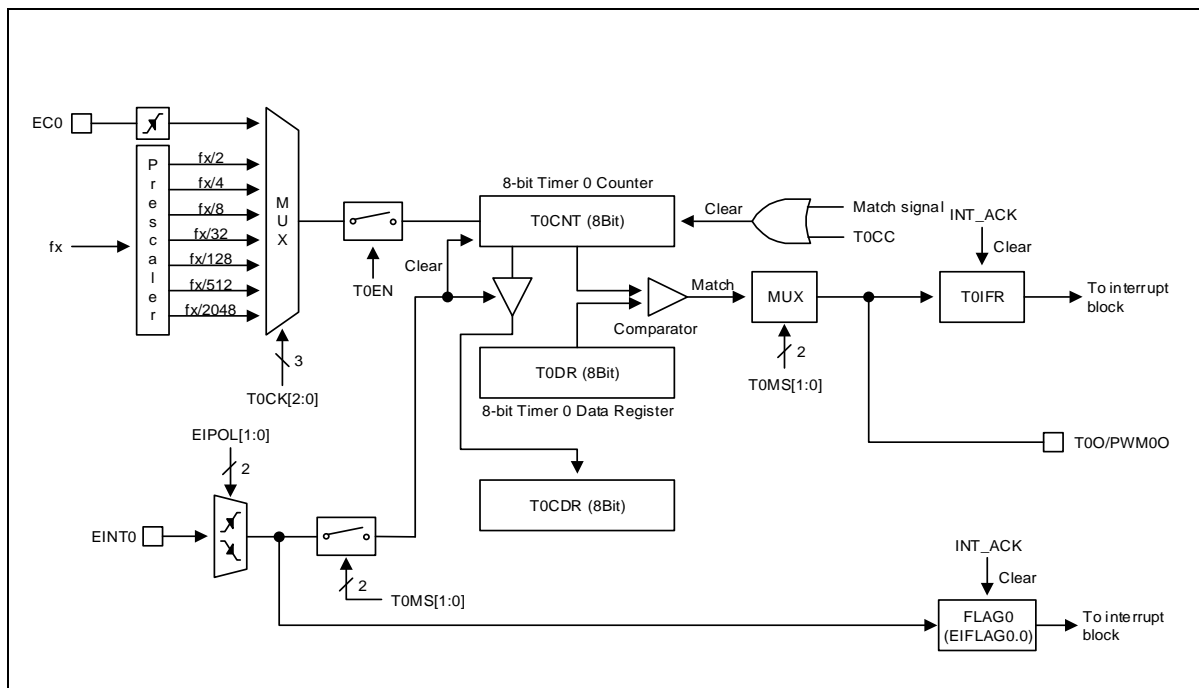

Figure 15. 8-bit Timer 0 Block Diagram

11.2 Timer 1

A 16-bit timer 1 consists of multiplexer, timer 1 A data register high/low, timer 1 B data register high/low and timer 1 control register high/low (T1ADRH, T1ADRL, T1BDRH, T1BDRL, T1CRH, T1CRL, T1DRH, T1DRL).

Timer 1 operates in one of the following modes:

- 16-bit timer/counter mode
- 16-bit capture mode
- 16-bit PPG output mode (one-shot mode)
- 16-bit PPG output mode (repeat mode)

The timer/counter 1 uses an internal clock or an external clock (EC1) as an input clock source. The clock sources are introduced below, and one is selected by clock selection logic which is controlled by clock selection bits (T1CK[2:0]).

- TIMER 1 clock source: fX/1, 2, 4, 8, 64, 2048, HFO and EC1

In capture mode, the data is captured into input capture data register (T1BDRH/T1BDRL) by EINT11. Timer 1 results in the comparison between counter and data register through T1O port in timer/counter mode. In addition, Timer 1 outputs PWM waveform through PWM1Oport in the PPG mode.

Table 10. TIMER 1 Operating Modes

T1EN	P1FSRL[5:4]	T1MS[1:0]	T1CK[2:0]	Timer 1
1	11	00	XXX	16 Bit Timer/Counter Mode
1	00	01	XXX	16 Bit Capture Mode
1	11	10	XXX	16 Bit PPG Mode(one-shot mode)
1	11	11	XXX	16 Bit PPG Mode(repeat mode)

11.2.1 16-bit timer 1 block diagram

In this section, a 16-bit timer 1 is described in a block diagram.

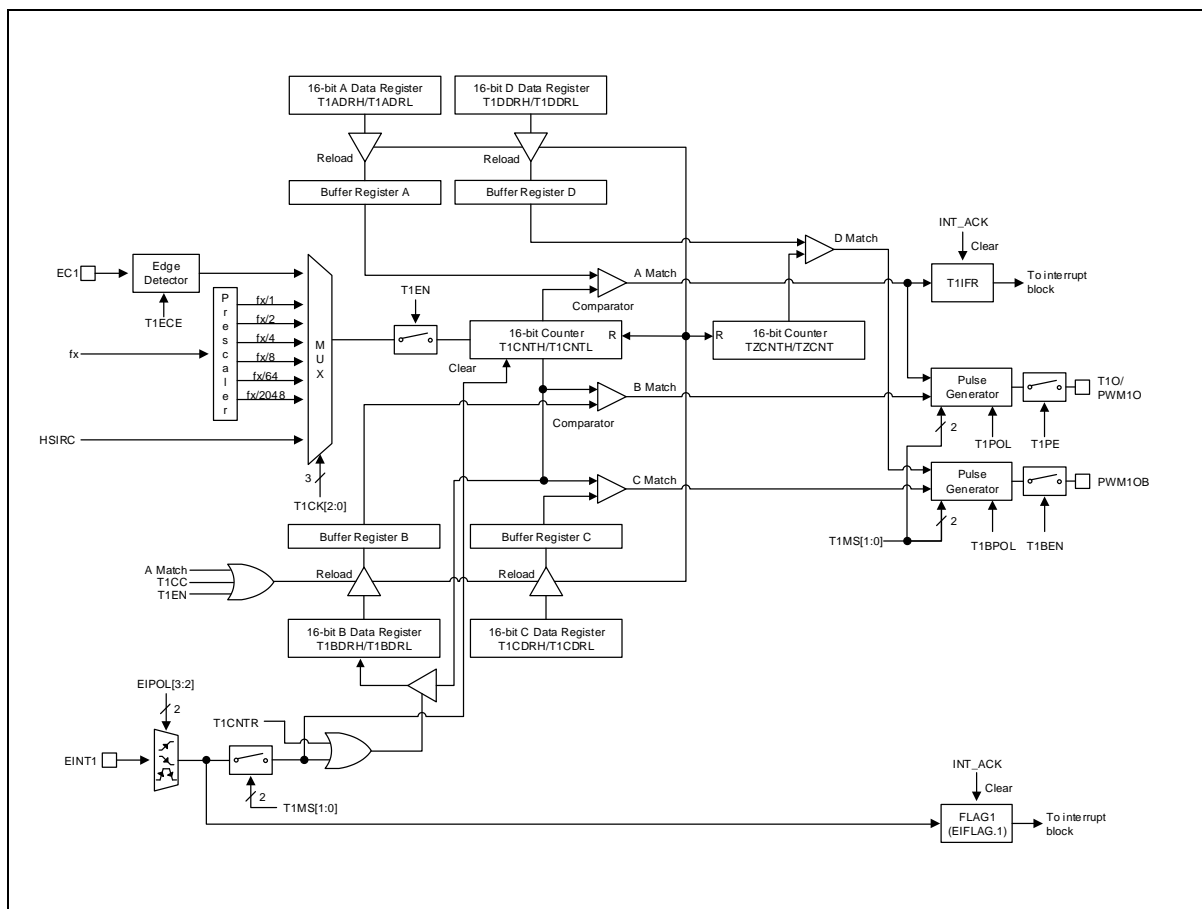

Figure 16. 16-bit Timer 1 Block Diagram

11.3 Timer 2

A 16-bit timer 2 consists of a multiplexer, timer 2 A data high/low register, timer 2 B data high/low register and timer 2 control high/low register (T2ADRH, T2ADRL, T2BDRH, T2BDRL, T2CRH, and T2CRL).

Timer 2 operates in one of the following modes:

- 16-bit timer/counter mode
- 16-bit capture mode
- 16-bit PPG output mode (one-shot mode)
- 16-bit PPG output mode (repeat mode)

The timer/counter 2 can be a divided clock of a system clock which is selected from prescaler output and T1 A Match (timer 1 A match signal). The clock source is selected by a clock selection logic, controlled by clock selection bits (T2CK[2:0]).

- TIMER 2 clock source: $f_x/1$, $f_x/2$, $f_x/4$, $f_x/8$, $f_x/32$, $f_x/128$, $f_x/512$ and T1 A Match

In capture mode, data is captured into input capture data registers (T2BDRH/T2BDRL) by EINT2. In timer/counter mode, whenever counter value is equal to T2ADRH/L, T2O port toggles. In addition, the timer 2 outputs PWM waveform to PWM2O port in the PPG mode.

Table 11. TIMER 2 Operating Modes

T2EN	P1FSRL[3:2]	T2MS[1:0]	T2CK[2:0]	Timer 2
1	11	00	XXX	16 Bit Timer/Counter Mode
1	00	01	XXX	16 Bit Capture Mode
1	11	10	XXX	16 Bit PPG Mode(one-shot mode)
1	11	11	XXX	16 Bit PPG Mode(repeat mode)

11.3.1 16-bit timer 2 block diagram

In this section, a 16-bit timer 2 is described in a block diagram.

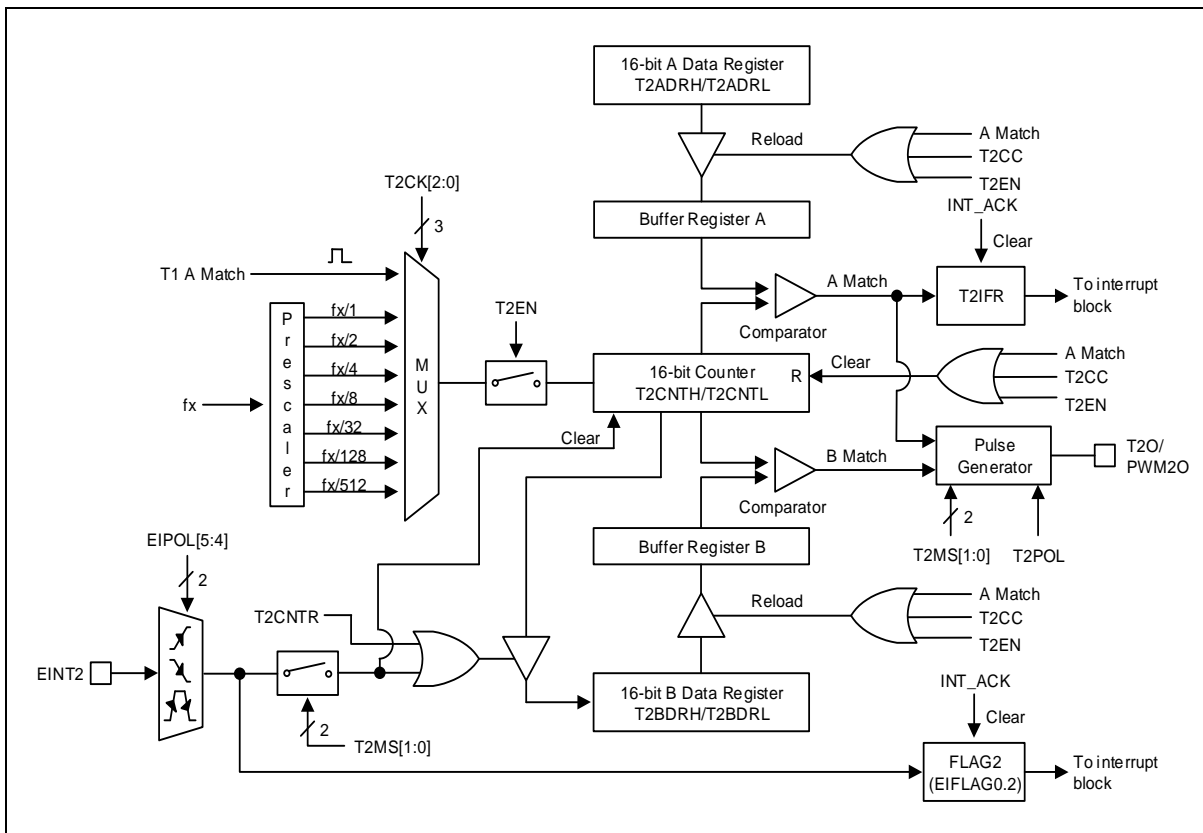

Figure 17. 16-bit Timer 2 Block Diagram

12 12-bit ADC

Analog-to-digital converter (ADC) of A96G181 allows conversion of an analog input signal to corresponding 12-bit digital value. This A/D module has eight analog inputs. Output of the multiplexer becomes input into the converter which generates the result through successive approximation.

The A/D module has four registers which are the A/D converter control high register (ADCCRH), A/D converter control low register (ADCCRL), A/D converter data high register (ADCDRH), and A/D converter data low register (ADCDRL).

ADSEL[3:0] bits are used to select channels to be converted. To execute A/D conversion, TRIG[2:0] bits should be set to 'xxx'. Registers ADCDRH and ADCDRL contain the result of A/D conversion. When the conversion is completed, the result is loaded into ADCDRH and ADCDRL, A/D conversion status bit AFLAG is set to '1', and A/D interrupt is set. During the A/D conversion, AFLAG bit is read as '0'.

12.1 Block diagram

In this section, the 12-bit ADC is described in a block diagram, and an analog input pin and a power pin with capacitors respectively are introduced.

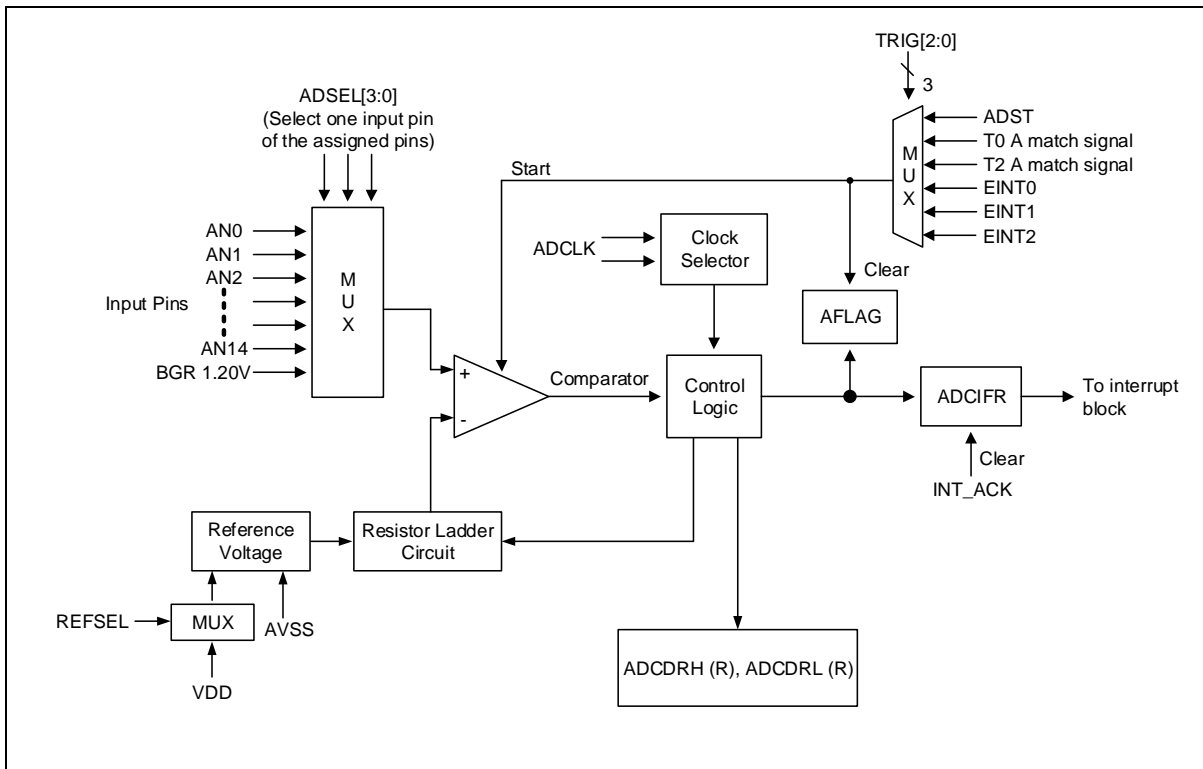

Figure 18. 12-bit ADC Block Diagram

Figure 19. A/D Analog Input Pin with a Capacitor

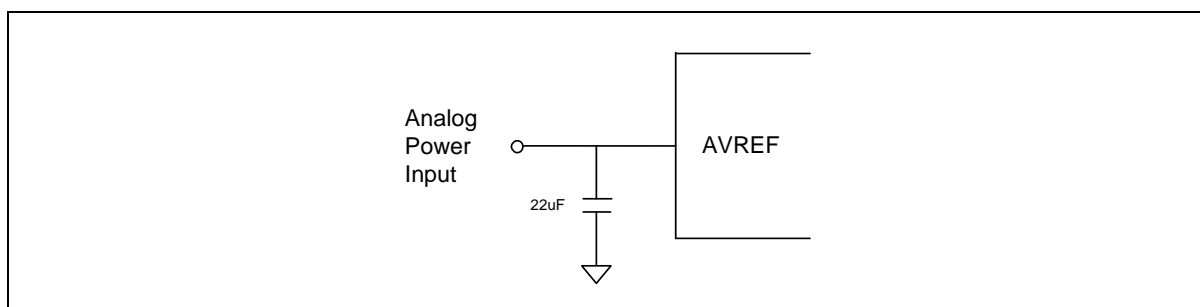

Figure 20. A/D Power (AVREF) Pin with a Capacitor

13 Power down operation

A96G181 has two power-down modes to minimize the power consumption of the device. In power down mode, power consumption is reduced considerably. A96G181 provides three kinds of power saving functions such as Main-IDLE mode, Sub-IDLE mode and STOP mode. During one of these three modes, program will be stopped.

13.1 Peripheral operation in IDLE/ STOP mode

Table 12 shows operation status of each peripheral in IDLE mode and STOP mode.

Table 12. Peripheral Operation Status during Power-down Mode

Peripheral	IDLE mode	STOP mode
CPU	ALL CPU operations are disabled.	ALL CPU operations are disabled.
RAM	Retains.	Retains.
Basic Interval Timer	Operates continuously.	Stops (can be operated with WDTRC OSC).
Watch Dog Timer	Operates continuously.	Stops (can be operated with WDTRC OSC).
Timer0~2	Operates continuously.	Halts (only when the event counter mode is enabled, timer operates normally).
ADC	Operates continuously.	Stops.
Internal OSC (32MHz)	Oscillates.	Stops when the system clock (f_x) is f_{HSIRC} .
WDTRC OSC (128kHz)	Can be operated with setting value.	Can be operated programmable.
I/O Port	Retains.	Retains.
Control Register	Retains.	Retains.
Address Data Bus	Retains.	Retains.
Release Method	By RESET All Interrupts	By RESET Timer Interrupt (EC0, EC1) External Interrupt (EINT0, EINT1, EINT2) WDT, BIT

14 Reset

Table 13 shows hardware setting values of main peripherals.

Table 13. Hardware Setting Values in Reset State

On Chip Hardware	Initial Value
Program Counter (PC)	0000h
Accumulator	00h
Stack Pointer (SP)	07h
Peripheral Clock	On
Control Register	Refer to the Peripheral Registers

A96G181 has five types of reset sources as shown in the followings:

- External RESETB
- Power ON RESET (POR)
- WDT Overflow Reset (In the case of WDTEN = `1`)
- Low Voltage Reset (In the case of LVREN = `0`)
- OCD Reset

14.1 Reset block diagram

In this section, reset unit is described in a block diagram.

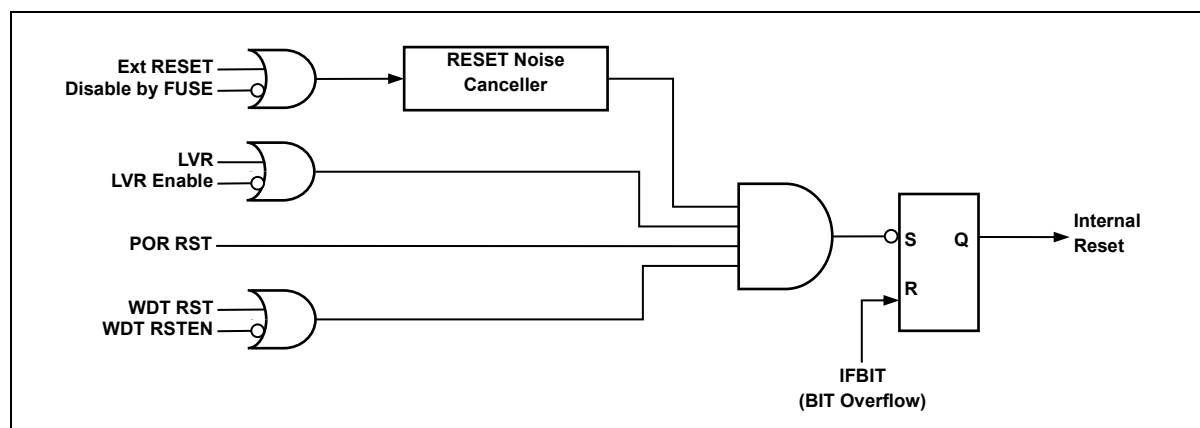

Figure 21. Reset Block Diagram

15 Memory programming

A96G181 has flash memory to which a program can be written, erased, and overwritten while mounted on the board. Serial ISP mode is supported.

Flash of A96G181 features the followings:

- Flash Size : 2Kbytes
- Single power supply program and erase
- Command interface for fast program and erase operation
- Up to 30,000 program/erase cycles at typical voltage and temperature for flash memory
- Security feature

15.1 Memory map

15.1.1 Flash memory map

Program memory uses 2K bytes of flash memory. It is read by byte and written by byte or page. One page is 32-bytes

Figure 22. Flash Memory Map

Figure 23. Address Configuration of Flash Memory

16 Electrical characteristics

16.1 Absolute maximum ratings

Table 14. Absolute Maximum Ratings

Parameter	Symbol	Rating ^{NOTE2}	Unit	Note
Supply Voltage	VDD	-0.3~+6.5	V	–
Normal Voltage Pin	V _I	-0.3~VDD+0.3	V	Voltage on any pin with respect to VSS
	V _O	-0.3~VDD+0.3	V	
	V _{IK} ^{NOTE3}	V _{IK} < 6.5	V	I _{IK} = 200uA
		(VDD-V _{IK}) < 6.5	V	I _{IK} = -200uA
	I _{OH}	10	mA	Maximum current output sourced by (I _{OH} per I/O pin)
	∑I _{OH}	80	mA	Maximum current (∑I _{OH})
	I _{OL}	80	mA	Maximum current (I _{OL} per I/O pin)
∑I _{OL}	100	mA	Maximum current (∑I _{OL})	
Total Power Dissipation	P _T	600	mW	–
Storage Temperature	T _{STG}	-65~+150	°C	–

NOTE:

1. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The measured value for the parameters and conditions listed were confirmed by simulation.
3. V_{IK} is instantaneous voltage like noise. (Burst, Impulse etc)

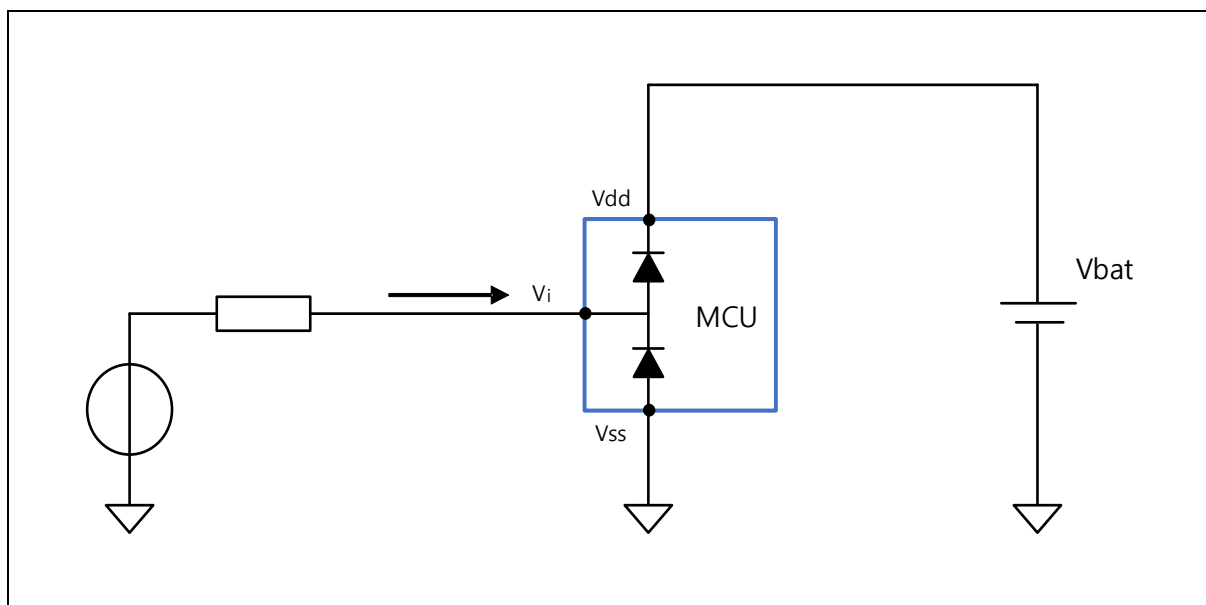

Figure 24. Describing V_{IK}

16.2 Recommended operating conditions

Table 15. Recommended Operating Conditions

(T_A=-40°C ~ 85°C or T_A=-40°C ~ 105°C)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
Operating Voltage	VDD	f _x = 0.5 ~16MHz Internal RC	1.8	–	5.5	V
Operating Temperature	T _{OPR}	VDD=1.8~5.5V	-40	–	85	°C
			-40	–	105	

16.3 A/D converter characteristics

Table 16. A/D Converter Characteristics

(T_A=-40°C ~ +85°C or T_A=-40°C ~ +105°C, VDD=2.2V ~ 5.5V, VSS=0V)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit	
Integral Linear Error	ILE	AVDD = 5.0V MCLK = 8MHz	–	±4	±8	LSB	
Differential Linearity Error	DLE		–	±1	±2		
Offset Error of Top	EOT		–	±4	±8		
Offset Error of Bottom	EOB		–	±2	±4		
Conversion Time	t _{CON}	12-bit resolution, 8MHz	8	–	–	us	
Analog Input Voltage	V _{AN}	–	VSS	–	VDD	V	
Analog Input Leakage Current	I _{AN}	VDDREF=5.12V	–	–	2	uA	
ADC Operating Current	I _{ADC} ^{NOTE6}	Enable	VDD=5.12V	–	1	2	mA
		Disable		–	–	0.1	uA

NOTES:

1. Zero offset error is the difference between 000000000000 and the converted output for zero input voltage (VSS).
2. Full scale error is the difference between 111111111111 and the converted output for full-scale input voltage (AVREF).
3. When VDD is lower than 2.2V, the ADC resolution will get worse.
4. If VDD is less than or equal to 2.2V, the resolution degrades by 1-bit whenever VDD drops 0.1V. (@ADCLK = 0.5MHz, under 2.2V, resolution has no test.)
5. ADCLK must be less than 0.5MHz. Furthermore, if ADCLK is less than 0.125MHz, it can be improved INL characteristic.
6. The measured value for the parameters and conditions listed were confirmed by simulation.

Table 17. Recommended ADC Resolution

(T_A=-40°C ~ +85°C or T_A=-40°C ~ +105°C, VDD=1.8V ~ 5.5V, VSS=0V)

VDD [V]	Resolution	Conditions
2.6	12-bit / Upper 12-bit	ADCLK ≤ 0.5MHz
2.5	12-bit / Upper 12-bit	
2.4	12-bit / Upper 12-bit	
2.3	12-bit / Upper 12-bit	
2.2	11-bit / Upper 11-bit	
2.1	10-bit / Upper 10-bit	
2.0	9-bit / Upper 9-bit	
1.9	8-bit / Upper 8-bit	
1.8	7-bit / Upper 7-bit	

NOTE : Guaranteed by design

16.4 BGR Characteristics

Table 18. BGR Characteristics

($T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$ or $T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$, $V_{DD} = 1.8\text{V} \sim 5.5\text{V}$, $V_{SS} = 0\text{V}$)

Parameter	Symbol	Conditions	MIN	TYP	MAX	Unit
BGR Reference Voltage	V_{BGR}	$T_A = +25^{\circ}\text{C}$	1.164	1.200	1.236	V
		$T_A = -40^{\circ}\text{C} \sim +85^{\circ}\text{C}$	1.146	1.200	1.254	
		$T_A = -40^{\circ}\text{C} \sim +105^{\circ}\text{C}$	1.140	1.200	1.260

17 Development tools

This chapter introduces a wide range of development tools for microcontrollers. ABOV offers software tools, debuggers, and programmers to help a user in generating right results to match target applications. ABOV supports entire developer ecosystem of the customers.

17.1 Compiler

ABOV semiconductor does not provide any compiler for the A96G181. Regarding the compilers, it is recommended to consult with your compiler provider.

Since A96G181 has the Mentor 8051 as a core, and ROM is smaller than 64Kbytes in size, a developer can use any standard 8051 compiler from other providers.

17.2 Core and debug tool information

ABOV's microcontroller uses OCD (On-Chip Debugger) interface for debugging, which is ABOV's own interface. The OCD not only monitors and controls the core, but also supports the read and write operations of external memory and devices. In addition, it supports memory monitoring and break functions.

Debug interfaces such as OCD interfaces enable microcontrollers to write to internal programmable memory, allowing them to support ISP (In-System Program) that makes possible to write as a single chip or as an embedded chip in the system. Table 28 provides information of the core and debug emulation interface.

Table 28. Information of Core and Debug Emulation Interfaces

	Description	Remark
Device Name	A9xXxxx	
Series	94/ 95/ 96/ 97 series	
Core	M8051/ CM8051	
Extended Stack Pointer	Yes/ no	94, 97 series only
Debug Interface	OCD 1/ OCD 2	
Number of Break Point	4/ 8	
Real-time Monitoring	Yes/ no	OCD 2 only
Run Flag Port	Yes/ no	OCD 2 option

NOTES:

1. The A96G181 has the 96 series core and OCD 1 interface.
2. The A96G181 can be operated with OCD II dongle too, because the OCD II dongle includes all of OCD1 functions.
3. The 95 series core is the old version of the 96 series core.

17.2.1 Feature of 94/96/97 series core

ABOV's 8-bit microcontroller contains the M8051/CM8051 core that is an improved version of the 8051. The M8051/CM8051 core is compatible with the 8051, and reduces time of operation cycles. It makes development easier by providing the OCD debug function.

ABOV's 8-bit microcontroller has a core of the 94-series, 96-series, or 97-series that is basically compatible with the 8051 series at the instruction set level. The cores in each series use different Debug Interfaces, as shown in Table 29.

Table 29. Cores and Debug Interface by Series

	Core	Debug Interface
96 Series	M8051	OCD 1
97 Series	M8051	OCD 2
94 Series	CM8051	OCD 2

Features of each series are compared in Table 30.

Table 30. Feature Comparison Chart By Series and Cores

	96 Series	97 Series	94 Series
CPU Core	M8051	M8051	CM8051
Cycle Compatible with MCS51	1/6	1/6	No
OCD Function	OCD 1	OCD 2	OCD 2
Program BUS	8-bit		
Data Bus	8-bit IRAM/ XRAM separated		8-bit single SRAM
EA Auto Clear ^{NOTE1}	Yes	Yes	Yes
EA=0, Idle/ Stope Mode Wake up	Yes	Yes	Yes
Interrupt Priority ^{NOTE2}	6 group x 4 level	Interrupt x 4 level	Interrupt x 2 level
Nested Interrupt Priority	4 level	4 level	Interrupt x 2 level (max. 4 times)
SFR BUS (read/ write)	Two ports	Two ports	Single port
Stack Extension	X	O	O
Register	SRAM		
Register Bank	4		
CPU/ Flash Clock Ratio	x 1		

Table 30. Feature Comparison Chart By Series and Cores (continued)

	96 Series	97 Series	94 Series
Pipeline	No	No	2-stage (IF + ID/ EX)
DHRY Stone Score (I8051: 1.00)	6.0	6.0	8.4
Average Instruction Set Exe. Cycle Compare with i8051	x 6.0	x 6.0	x 6.4
Power Consumption/ DHRY (@synthesis)	52.27uA/ MHz	52.27uA/ MHz	30.19 uA/ MHz

NOTE:

1. EA means that All Interrupt Enable bit or Disable bit (Standard 8051).
2. Group: When a programmer selects a specific interrupt (e.g. Interrupt1), Whole interrupts: 0, 6, 12, and 18 have higher priorities.
3. The A96G181 has the 96 series core and OCD 1 interface.
4. The A96G181 can be operated with the OCD II dongle too, because the OCD II dongle includes all functions of the OCD1.

ABOV's 8-bit microcontroller maintains binary compatibility with 8051 cores; however, the cores and series have differences in performances, core functionalities, and debug interfaces.

You can see the differences between each series in the following sections.

17.2.2 OCD type of 94/96/97 series core

Cores of the 96-series use the OCD 1 for debug interfaces, while cores of the 94-series and 97-series use the OCD 2 for debug interfaces. The OCD 1 and OCD 2 use the same method on the Hardware, however, the protocols are incompatible with each other.

In the OCD 2, it is able to measure the emulation time through the "Run Flag" pin.

Table 31. OCD Type of Each Series

	96-Series	97-Series	94-Series	Remark
OCD type	OCD 1	OCD 2	OCD 2	

In Table 32, debug interfaces of the OCD 1 and OCD 2 are compared.

Table 32. Comparison of OCD 1 and OCD 2

	Value	Description
OCD 1	Break point MAX.8	PC break only
OCD 2	Break point MAX.12	With RAM break <ul style="list-style-type: none"> • Code, XDATA, IDATA • 1/8/16/32bit compare
	Real-time monitoring	Code, XDATA, IDATA
	Frequency output	Examine CPU frequency
	Run Flag port	Option for run time measurement

96 Series – OCD 1

The 96 series supports basic operation of debug interfaces such as Run, Stop, Step, Break point, register reading/ writing, Memory reading/ writing, and SFR reading/ writing.

94 Series and 97 Series – OCD 2

The 94 series and 97 series support the features listed below, as well as the features of the OCD 1 (however, their protocol is incompatible with the OCD1):

- RTM support: CODE, XDATA, IDATA are updated during the Run Time (Real Time Monitoring available).
- Run Flag support: Emulation Time can be measured in OCD mode (using the Run Flag port).
- RAM Break support: IDATA, SFR, and XDATA break are added.

17.2.3 Interrupt priority of 94/96/97 series core

In the M8051, users can set interrupt priorities by group. The 96-series microcontroller with the basic M8051 core only supports interrupt priorities in group units. In the 94-series or 97-series microcontroller, users set interrupt priorities to have more functionalities than existing features, and can set individual priority for each interrupt source.

Table 33. Interrupt Priorities in Groups and Levels

Series	96-Series	97-Series	94-Series	Remark
Interrupt Priority	6 Grouped 4 Level	Fully 4 Level	Fully 4 Level	96 Series: IP/IP (Interrupt Priority Register) 94, 97 Series: IPxL/IPxH (Interrupt Priority Register)

96 Series

- The priority by group is available only with IP/IP1 settings.
 - With the IP/IP1 settings, users can set the interrupt priorities in group units.
 - The interrupt priority in group units (4 interrupts in a group) can be changed to the level between 0 and 3 according to the value of the IP/IP1.

94, 97 Series

- The individual interrupt priority can be set by setting IPxL/IPxH (x = 0 to x = 3).
- The individual interrupt priority can be changed to the level between 0 and 3 according to value of the IPxL/IPxH (x = 0 to x = 3).

17.2.4 Extended stack pointer of 94/96/97 series core

The M8051 uses IRAM area for Stack Pointer. However, 94-series and 97-series microcontrollers use both IRAM area and XRAM area for the Stack Pointer by configuring additional registers.

The XSP and XSPCR registers are involved in this functionality as described below:

- By configuring the XSP/XSPCR register, you can use the XRAM area for the Stack Pointer.
 - The XSPCR decides whether to use XRAM for the Stack Pointer.
 - ◆ If XSPCR = '0', the IRAM is available for the Stack Pointer.
 - ◆ If XSPCR = '1', the XRAM is available for the Stack Pointer.
 - The XSP decides a position of XRAM Stack Pointer.
 - ◆ This is valid only if XSPCR='1'.

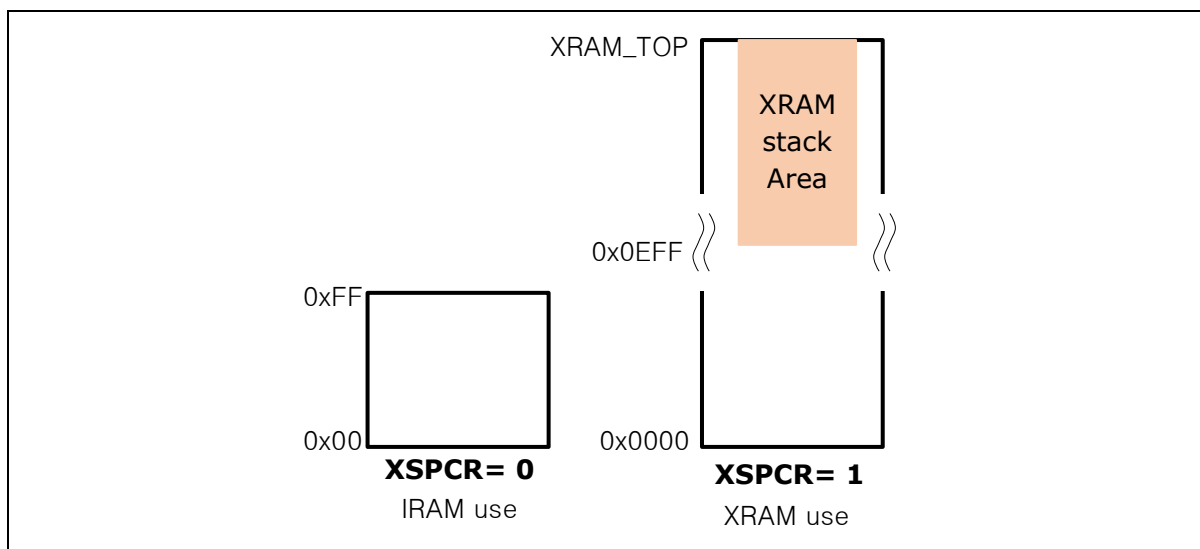

Figure 30. Configuration of the Extended Stack Pointer

$STACK_POINTER = \{XSP[7:0], SP[7:0]\} = XRAM_TOP - STACK_SIZE$

Ex) If only 256bytes of XRAM will be used for stack,

- XRAM_TOP = 4K(0x0FFF)
- STACK_SIZE = 256byte(0x0100)
- XSPCR= 1, XSP= 0x0E
- SP=0xFF setting
- Stack Pointer Position = 0x0FFF - 0x0100= 0x0EFF

17.3 OCD (On-chip debugger) emulator and debugger

Microcontrollers with 8051 cores have an OCD (On-Chip Debugger), a debug emulation block. The OCD is connected to a target microcontroller using two lines such as DSCL and DSDA. The DSCL is used for clock signal and the DSDA is used for bi-directional data.

The two lines work for the core management and control by doing register management and execution, step execution, break point and watch functions. In addition, they control and monitor the internal memory and the device by reading and writing.

Table 34. Debug Feature by Series

Series name	96-series	97-series	94-series
OCD function	OCD 1	OCD 2	OCD 2
Max. number of breakpoints	8	8	4
Saving stack in XRAM	No	Yes	Yes
Real time monitoring	No	Yes	Yes
Run flag support	No	Yes	Yes

The OCD 2 applied to the 94-series and 97-series provides the RTM (Real Time Monitoring) function that monitors internal memory and I/O status without stopping the debugging. In addition, the OCD 2 provides the breakpoint function (RAM Break Function) for the IDATA, SFR, and XDATA.

The following functions have been extended from the OCD 2:

- Emulation Time can be measured in OCD mode (using the Run Flag port)
- CODE, XDATA, and IDATA are updated during the Run Time (Real Time Monitoring available).
- IDATA, SFR, and XDATA break are added (RAM Break support).

Figure 31 shows the standard 10-pin connector of OCD 1 and OCD 2.

Figure 31. OCD 1 and OCD 2 Connector Pin Diagram

Table 35 introduces pins used for the OCD 1 and OCD 2.

Table 35. OCD 1 and OCD 2 Pin Description

Pin name	Microcontroller function in Debug Mode	
	I/O	Description
DSCL	I	Serial clock pin. Input only pin.
DSDA	I/O	<ul style="list-style-type: none"> Serial data pin. Output port when reading and input port when programming. IT can be assigned as input/push-pull output port.
VDD,VSS	—	Logic power supply pin.

The OCD emulator supports ABOV’s 8051 series MCU emulation. The OCD uses two wires that are interfaces between PC and MCU, which is attached to user’s system. The OCD can read or change the value of MCU’s internal memory and I/O peripherals. In addition, the OCD controls MCU’s internal debugging logic. This means that the OCD controls emulation, step run, monitoring and many more functions regarding debugging.

The OCD debugger program runs underneath MS operating system such as MS-Windows NT/ 2000/ XP/ Vista (32-bit). If you want to see more details, please visit ABOV’s website (www.abovsemi.com), and download debugger S/W and OCD debugger manuals.

- Connection:
 - DSCL (A96G181 P01 port)
 - DSDA (A96G181 P00 port)

Figure 32 shows pinouts of OCD connector.

Figure 32. Debugger (OCD1/OCD2) and Pinouts

17.3.1 On-chip debug system

A96G181 supports On-chip debug (OCD) system. We recommend developing and debugging program with A96G1xx series. The OCD system of the A96G181 can be used for programming the non-volatile memories and on-chip debugging.

In this section, you can find detailed descriptions for programming via the OCD interface. Table 36 introduces features of OCD.

Table 36. OCD Features

Two wire external interface	<ul style="list-style-type: none"> • 1 for serial clock input • 1 for bi-directional serial data bus
Debugger accesses	<ul style="list-style-type: none"> • All internal peripherals • Internal data RAM • Program Counter • Flash memory and data EEPROM memory
Extensive On-Chip Debugging supports for Break Conditions	<ul style="list-style-type: none"> • Break instruction • Single step break • Program memory break points on single address • Programming of Flash, EEPROM, Fuses, and Lock bits through the two-wire interface • On-Chip Debugging supported by Dr. Choice®
Operating frequency	The maximum frequency of a target MCU.

Figure 33 shows a block diagram of the OCD interface and the On-chip Debug system.

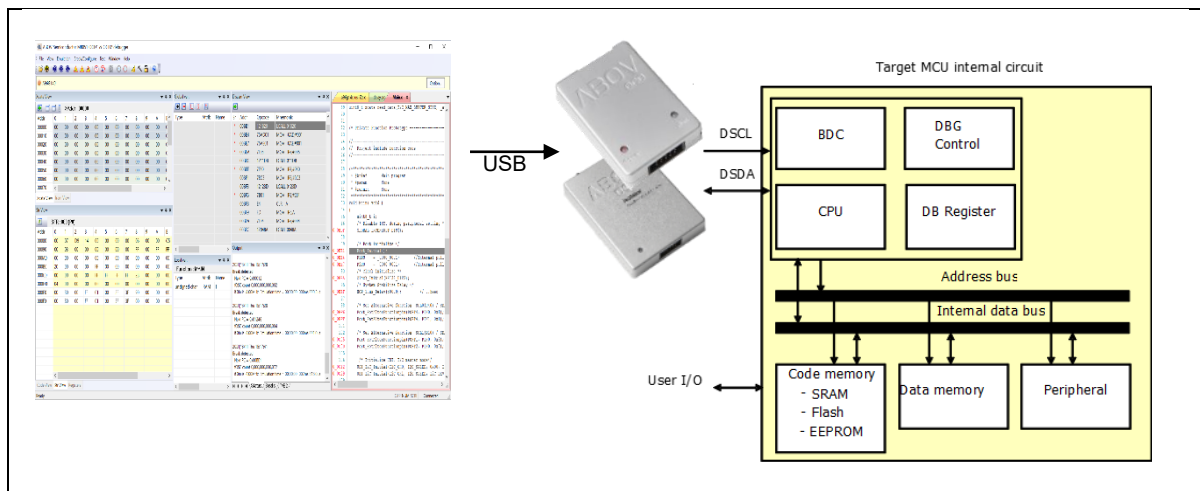

Figure 33. On-Chip Debugging System in Block Diagram

17.3.2 Entering debug mode

While communicating through the OCD, you can enter the microcontroller into DEBUG mode by applying power to it. This means that the microcontroller enters DEBUG mode when you place specific signals to the DSDL and DSDA at the moment of initialization when the microcontroller is powered on. This requires that you can control power of the microcontroller (VCC or VDD) and need to be careful to place capacitive loads such as large capacity condensers on a power pin.

Please remember that the microcontroller can enter DEBUG mode only when power is applied, and it cannot enter DEBUG mode once the OCD is run.

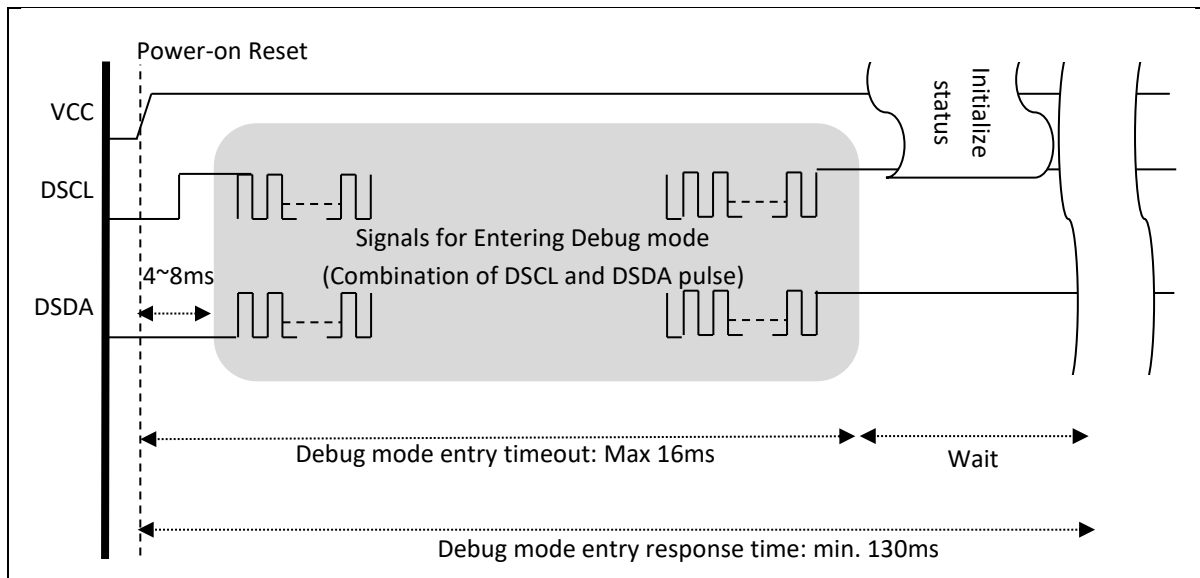

Figure 34. Timing Diagram of Debug Mode Entry

17.3.3 Two-wire communication protocol

For the OCD interface, the semi-duplex communication protocol is used through separate two wires, the DSCL and DSDA. The DSCL is used for serial clock signal and the DSDA is used for bi-directional serial address and data.

A unit packet of transmission data is 10-bit long and consists of a byte of data, 1-bit of parity, and 1-bit of acknowledge. A parity check bit and a receive acknowledge bit are transmitted to guarantee stability of the data communication. A communication packet includes a start bit and an end bit to indicate the start and end of the communication.

More detailed information of this communication protocol is listed below:

Basic transmission packet

- A 10-bit packet transmission using two-pin interface.
- A packet consists of 8-bit data, 1-bit parity and 1-bit acknowledge.
- Parity is even of '1' for 8-bit data in transmitter.
- Receiver generates acknowledge bit as '0' when transmission for 8-bit data and its parity has no error.
- When transmitter has no acknowledge (Acknowledge bit is '1' at tenth clock), error process is executed in transmitter.
- When acknowledge error is generated, host PC makes stop condition and transmits a command which has error again.
- Background debugger command is composed of a bundle of packet.
- Start and stop conditions notify start and stop of the background debugger command respectively.

Figure 35. 10-bit Transmission Packet

Packet transmission timing

Figure 36 shows a timing diagram of a packet transmission using the OCD communication protocol.

A start bit in the figure means start of a packet and is valid when the DSDA falls from 'H' to 'L' while External Host maintains the DSCL to 'H'. After the valid start bit, communication data is transferred and received between a Host and a microcontroller.

An end bit means end of the data transmission and is valid when the DSDA changes from 'L' to 'H' while a Debugger maintains the DSCL to 'H'. Next, the microcontroller places the bus in a wait state and processes the received data.

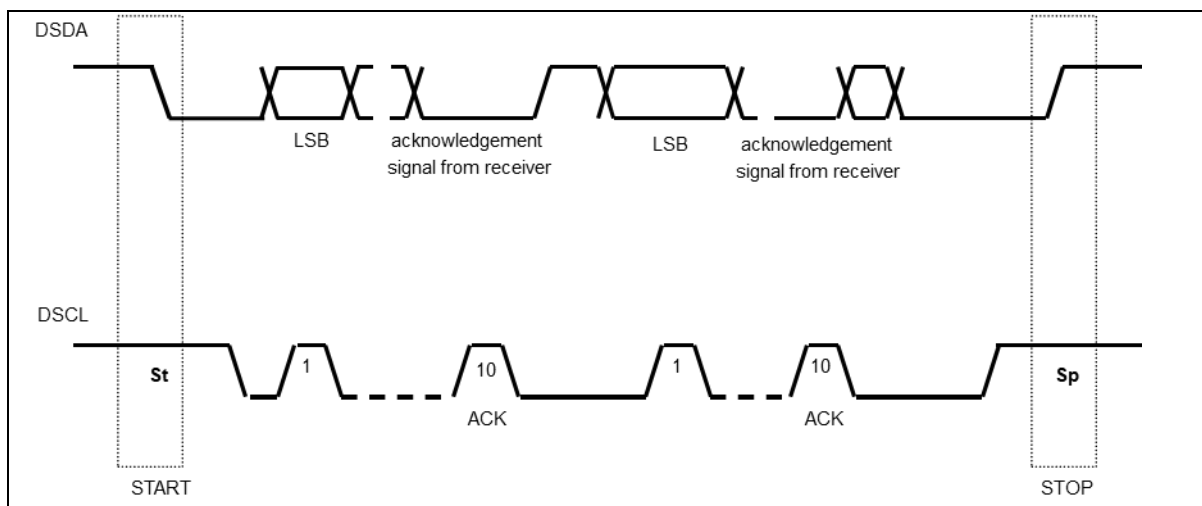

Figure 36. Data Transfer on OCD

Figure 37 shows a timing diagram of each bit based on state of the DSCL clock and the DSDA data. Similar to I2C signal, the DSDA data is allowed to change when the DSCL is 'L'. If the data changes when the DSCL is 'H', the change means 'START' or 'STOP'.

Figure 37. Bit Transfer on Serial Bus

Figure 38. Start and Stop Condition

During the OCD communication, each data byte is transferred in accompany with a parity bit. When data is transferred in succession, a receiver returns the acknowledge bit to inform that it received.

As shown in Figure 39, when transferring data, a receiver outputs the DSDA to 'L' to inform the normal reception of data. If a receiver outputs DSDA to 'H', it means error reception of data.

Figure 39. Acknowledge on Serial Bus

While the Host Debugger executes data communications, if a microcontroller needs communication delay or process delay, it can request communication delay to the Host Debugger.

Figure 40 shows timing diagrams where a microcontroller requests communication delay to the Host Debugger. If the microcontroller requests timing delay of the DSDCL signal that the Host Debugger outputs, the microcontroller maintains the DSDCL signal to 'L' to delay the clock change although the Host Debugger changes the DSDCL to 'H'.

Figure 40. Clock Synchronization during Wait Procedure

17.4 Programmers

17.4.1 E-PGM+

E-PGM+ USB is a single programmer. You can program A96G181 directly using the E-PGM+.

Figure 41. E-PGM+ (Single Writer) and Pinouts

17.4.2 OCD emulator

OCD emulator allows users to write code on the device too, since OCD debugger supports In System Programming (ISP). It doesn't require additional H/W, except developer's target system.

17.4.3 Gang programmer

E-Gang4 and E-Gang6 allow users to program multiple devices simultaneously. They can be run not only in PC controlled mode but also in standalone mode without the PC control.

USB interface is available, and it is easy to connect to the handler.

Figure 42. E-Gang4 and E-Gang6 (for Mass Production)

17.5 Flash programming

Program memory for A96G181 is a Flash type. This Flash ROM is accessed through four pins such as DSCL, DSDA, VDD, and VSS in serial data format. For detailed information about the Flash memory programming, please refer to **15. Memory programming**.

Table 37 introduces each pin and corresponding I/O status.

Table 37. Pins for Flash Programming

Pin name	Main chip pin name	During programming	
		I/O	Description
DSCL	P01	I	Serial clock pin. Input only pin.
DSDA	P00	I/O	Serial data pin. Output port when reading and input port when programming. Can be assigned as input/push-pull output port.
VDD, VSS	VDD, VSS	—	Logic power supply pin.

17.5.1 On-board programming

Microcontrollers need only four signal lines including VDD and VSS pins, to program the Flash ROM using serial protocol. Therefore, on-board programming is possible if the programming signal lines are considered at the time the PCB of application board is designed.

17.6 Connection of transmission

OCD's two-wire communication interface uses Open-Drain Method (Wire-AND Bi-Directional I/O).

Normally, it is recommended to place a resistor greater than 4.7kΩ for DSCL and DSDA respectively. The capacitive load is recommended to be less than 100pF. Outside these ranges, because the communication may not be accomplished, the connection to Debug mode is not guaranteed.

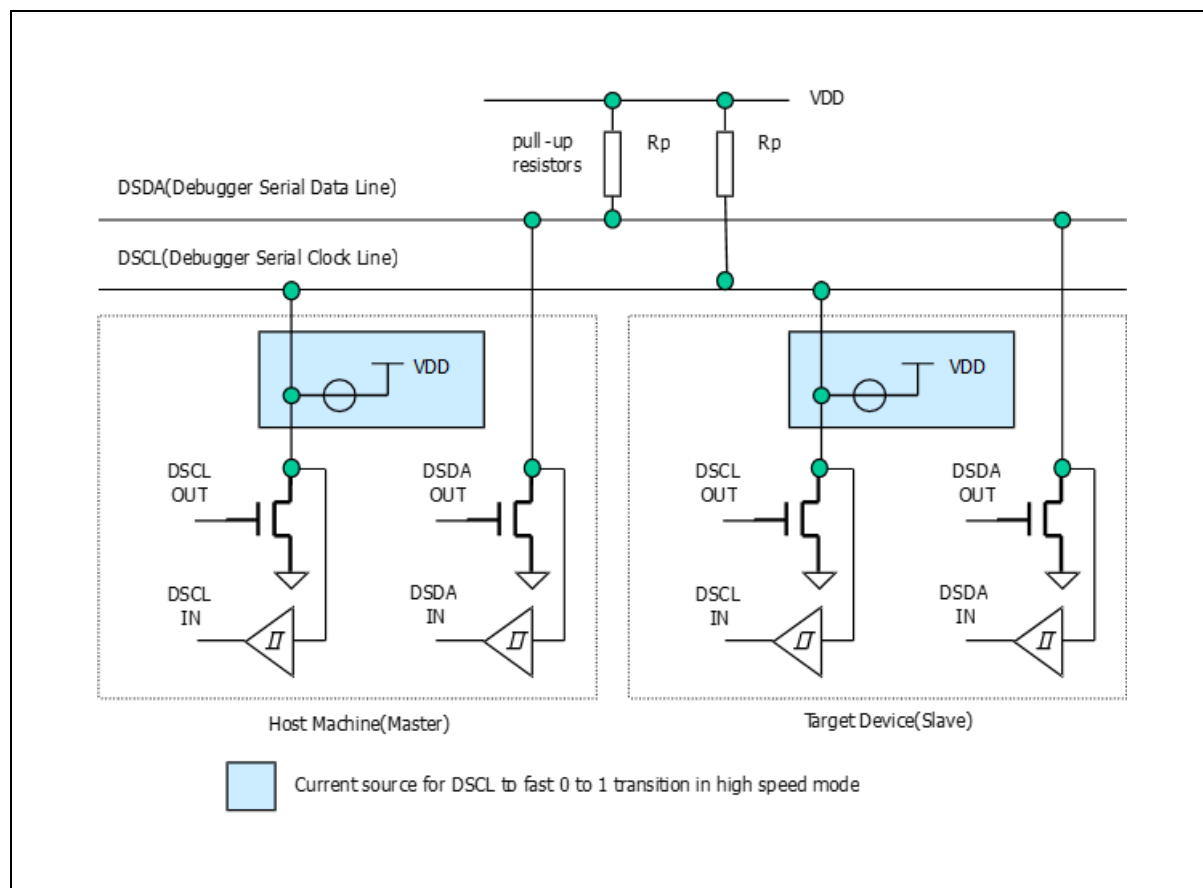

Figure 43. Connection of Transmission

17.7 Circuit design guide

To program Flash memory, programming tools require 4 signal lines, DSCL, DSDA, VDD, and VSS. When designing a PCB circuit, you should consider these 4 signal lines for on-board programming. In addition, you need to be careful when designing the related circuit of these signal pins, because rising/falling timing of the DSCL and DSDA is very important for proper programming.

When you use the OCD pins exclusively or share them with other functions, it needs to be careful, too.

Figure 44 shows an example circuit where the OCD pins (DSCL and DSDA) are shared with other functions. They must be connected when debugging or executing In System Program (ISP).

Normally, the OCD pins are connected to outside to execute the predefined functions. Even when they are connected for debugging or executing ISP directly, the OCD pins are shared with other functions by using resistors as shown in Figure 44. By doing this, the OCD pins process the normal external signals and execute the OCD functions first when they are shared.

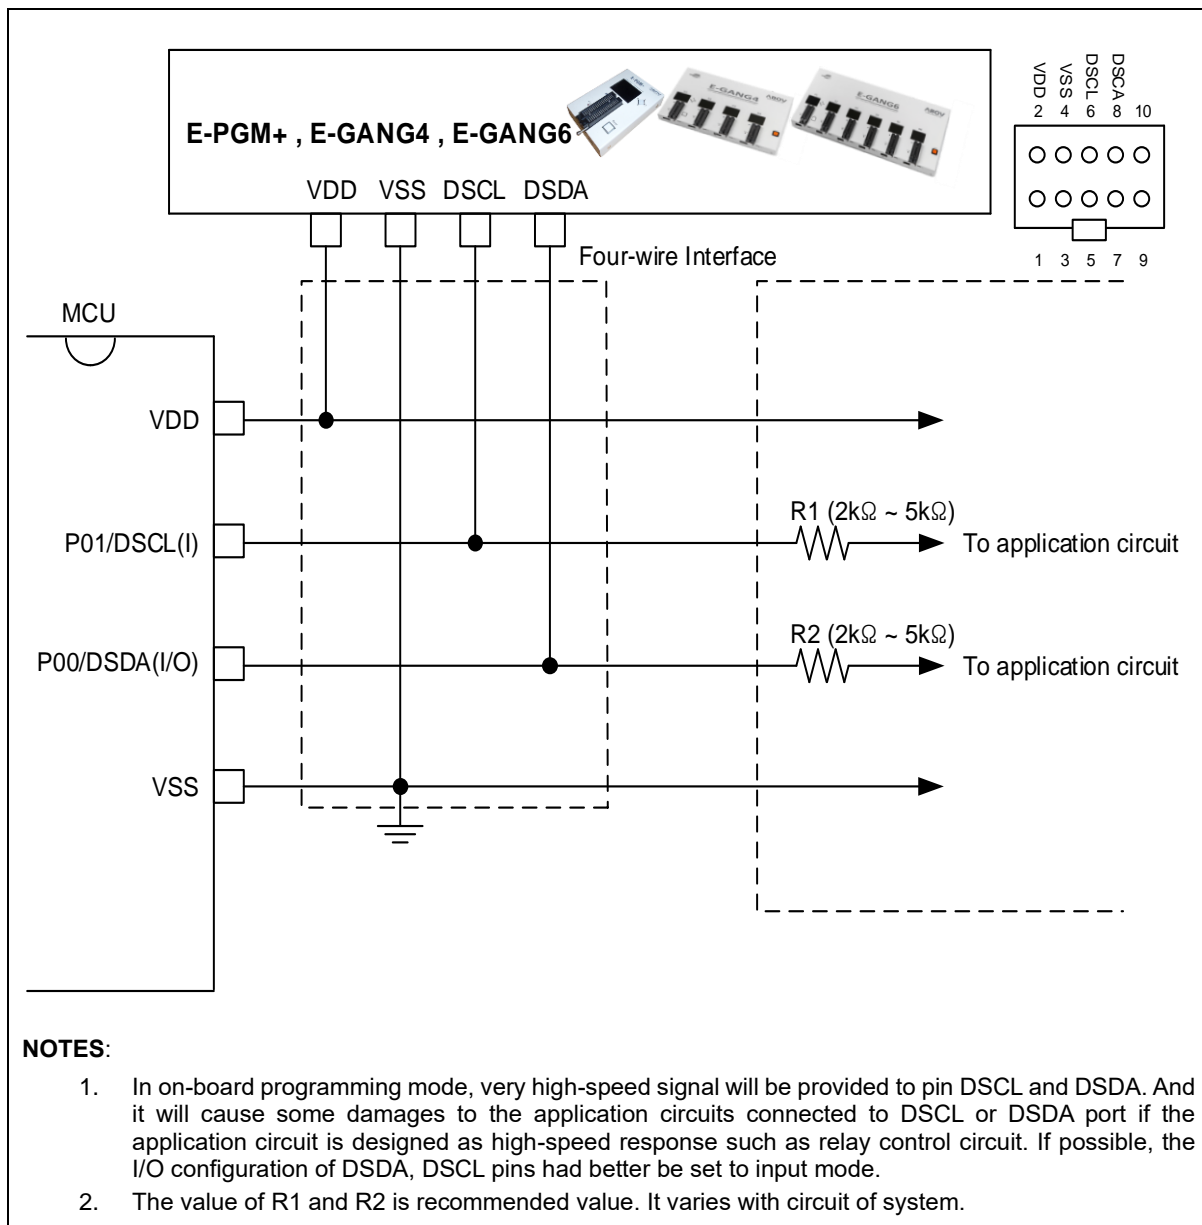

Figure 44. PCB Design Guide for On-Board Programming

18 Package information

This chapter provides A96G181 package information.

18.1 10 SSOP package information

Figure 45. 10 SSOP Package Outline

18.2 8 SOP package information

Figure 46. 8 SOP Package Outline

19 Ordering information

Table 38. A96G181 Device Ordering Information

Device name	FLASH	XRAM	IRAM	ADC	I/O PORT	Package	Temperature Range
A96G181DS	2Kbytes	-	256bytes	8 inputs	8	10 SSOP	-40°C ~ +85°C
A96G181HD				6 inputs	6	8 SOP	
A96G181DS2	2Kbytes	-	256bytes	8 inputs	8	10 SSOP	-40°C ~ +105°C
A96G181HD2				6 inputs	6	8 SOP

Appendix

Instruction table

Instructions are either 1, 2 or 3 bytes long as listed in the 'Bytes' column below. Each instruction takes either 1, 2 or 4 machine cycles to execute as listed in the following table. 1 machine cycle comprises 2 system clock cycles.

Table 39. Instruction Table

Arithmetic				
Mnemonic	Description	Bytes	Cycles	Hex code
ADD A,Rn	Add register to A	1	1	28-2F
ADD A,dir	Add direct byte to A	2	1	25
ADD A,@Ri	Add indirect memory to A	1	1	26-27
ADD A,#data	Add immediate to A	2	1	24
ADDC A,Rn	Add register to A with carry	1	1	38-3F
ADDC A,dir	Add direct byte to A with carry	2	1	35
ADDC A,@Ri	Add indirect memory to A with carry	1	1	36-37
ADDC A,#data	Add immediate to A with carry	2	1	34
SUBB A,Rn	Subtract register from A with borrow	1	1	98-9F
SUBB A,dir	Subtract direct byte from A with borrow	2	1	95
SUBB A,@Ri	Subtract indirect memory from A with borrow	1	1	96-97
SUBB A,#data	Subtract immediate from A with borrow	2	1	94
INC A	Increment A	1	1	04
INC Rn	Increment register	1	1	08-0F
INC dir	Increment direct byte	2	1	05
INC @Ri	Increment indirect memory	1	1	06-07
DEC A	Decrement A	1	1	14
DEC Rn	Decrement register	1	1	18-1F
DEC dir	Decrement direct byte	2	1	15
DEC @Ri	Decrement indirect memory	1	1	16-17
INC DPTR	Increment data pointer	1	2	A3
MUL AB	Multiply A by B	1	4	A4
DIV AB	Divide A by B	1	4	84
DAA	Decimal Adjust A	1	1	D4

Table 39. Instruction Table (continued)

Logical				
Mnemonic	Description	Bytes	Cycles	Hex code
ANL A,Rn	AND register to A	1	1	58-5F

Table 39. Instruction Table (continued)

Miscellaneous				
Mnemonic	Description	Bytes	Cycles	Hex code
NOP	No operation	1	1	00

Table 39. Instruction Table (continued)

Additional instructions (selected through EO[7:4])				
Mnemonic	Description	Bytes	Cycles	Hex code
MOVC @(DPTR++),A	M8051W/M8051EW-specific instruction supporting software download into program memory	1	2	A5
TRAP	Software break command	1	1	A5

In the above table, entries such as E8-EF indicate continuous blocks of hex opcodes used for 8 different registers. Register numbers of which are defined by the lowest three bits of the corresponding code. Non-continuous blocks of codes, shown as '11→F1' (for example), are used for absolute jumps and calls, with the top 3 bits of the code being used to store the top three bits of the destination address.

CJNE instructions use abbreviation of #d for immediate data; other instructions use #data as an abbreviation.

Revision history

Date	Revision	Description
2020.07.14	1.00	First creation.
2020.08.31	1.01	Updated WDT Register map.
2020.09.28	1.02	Updated the initial value in Table 6. SFR Map. Updated a typo in Table 19. Power-on Reset Characteristics.
2021.04.26	1.03	Updated High Speed Internal RC Oscillator Tolerance at Table 21. High Speed Internal RC Oscillator Characteristics. Corrected the frequency unit from KHz to kHz.
2022.04.01	1.04	Updated Table 18. BGR Characteristics at Electrical characteristics
2022.04.12	1.05	Added 4 Central processing unit. Updated 17 Development tools chapter. Marked simulation data at 16 Electrical characteristics. Added Figure 28. Filters used on a Reset Pin Diagram and Table 27 Reset Pin Component Values on page 56. Deleted the table of Input/Output Capacitance at 16 Electrical Characteristics.
2022.12.07	1.06	Revised the font of this document.
2023.03.13	1.07	Added the maximum allowable voltage (V_{IK}) in chapter 16.1 Absolute Maximum Ratings. Added the Figure describing V_{IK} in chapter 16.1 Absolute Maximum Ratings.
2023.04.04	1.08	Fixed Table 24. RESETB Input low width 10us->50us
