4-BIT SINGLE CHIP MICROCOMPUTERS

ADAM24P16S USER`S MANUAL

- ADAM24P16S
- ADAM24P16ST

1. Overview ADAM24P16S

1. OVERVIEW

The ADAM24P16S is remote control transmitter which uses CMOS technology. The ADAM24P16S is suitable for remote control of TV, VCR, FANS, Air-conditioners, Audio Equipments, Toys, Games etc. The ADAM24P16S is OTP version.

1.1. Features

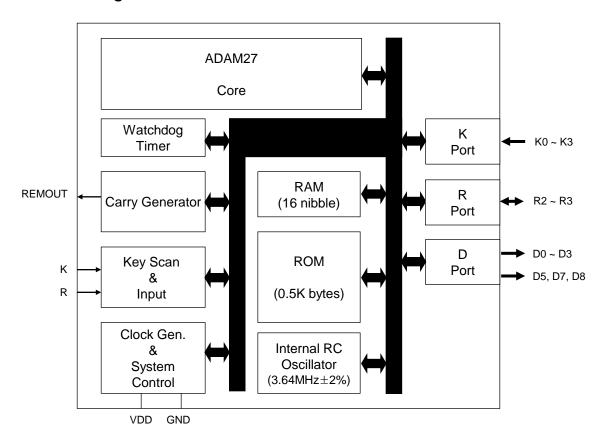

- Program memory
 - 512 bytes (512 x 8bit)
- Data memory (RAM)
 - 16 nibble (16 x 4bit)
- 3 levels of subroutine nesting
- 8-bit Table Read Instruction
- Oscillator Type (Operating frequency)
 - Internal RC Oscillator (typically 3.64MHz ±2%)
- Instruction cycle
 - fosc/48
- Stop mode
- Released stop mode by key input
- Built in Power-on Reset circuit
- Built in Transistor for I.R LED Drive
 - IoL=250mA at VDD=3V and Vo=0.3V
- Built in Low Voltage reset circuit
- Built in a watch dog timer (WDT)
- Low operating voltage
 - 1.8 ~ 3.6V
- 16-SOP/TSSOP Package.

Series	ADAM24P16S	ADAM24P16ST

1.7. Electrical Characteristics

1.7.1. Absolute Maximum Ratings (Ta = 25° C)

Parameter	Parameter Symbol Max. rating		Unit
Supply Voltage	VDD	-0.3 ~ 5.0	V
Power dissipation	PD	700 *	mW
Input voltage	VIN	-0.3 ~ VDD+0.3	V
Output voltage	Vouт	-0.3 ~ VDD+0.3	V
Storage Temperature	Тѕтс	-65 ~ 150	°C

1.7.2. Recommended operating condition

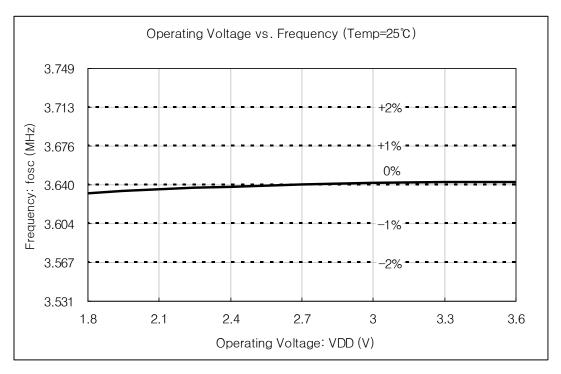

Parameter	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Supply Voltage	Vdd	fOSC = 3.64MHz	1.8	-	3.6	V
Oscillation Frequency	fosc	VDD=1.8 ~ 3.6V Temp. = -20 ~ 70 °C	3.567 (-2%)	3.640	3.713 (+2%)	MHz
Operating temperature	Topr	-	-20	-	70	°C

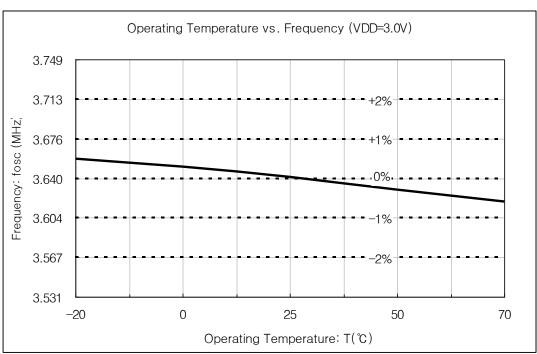

1.7.3. DC Characteristics (Ta = $25 \,^{\circ}$ C, VDD=3V)

Parameter	Currely of		Limits		l lmit	Condition	
Parameter	Symbol	Min.	Тур.	Max.	Unit	Condition	
Input H current	Іін	-	-	1	μA	VI=VDD	
Input Pull-up Resistance	Rpu	70	120	300	kΩ	VI=GND	
Input H voltage	V _{IH1}	2.1	-	-	V	-	
Input L voltage	VIL1	-	-	0.9	V	-	
D output L voltage	Vol1	-	0.15	0.4	٧	IoL=3 ^{mA}	
REMOUT output L current	loL	-	250	-	mA	VoL=0.3V	
REMOUT leakage current	lolk1	-	-	1	μA	VOUT=VDD, Output off	
D output leakage current	lolk2	-	-	1	μA	VOUT=VDD, Output off	
Current on STOP mode	ISTP	-	-	1	μA	At STOP mode	
Operating supply current	loo	-	0.5	1.0	mA	fosc = 3.64MHz	

1. Overview ADAM24P16S

**** Internal RC Oscillator Characteristics Graphs (for reference only)**

2. ARCHITECTURE

2.1. Program Memory

The ADAM24P16S can incorporate maximum 512 words (1 block \times 8 pages \times 64 words \times 8bits) for program memory. Program counter PC (A0~A5) and page address register PA(A6~A8) are used to address the whole area of program memory having an instruction (8bits) to be next executed.

The program memory consists of 64 words on each page, and thus each page can hold up to 64 steps of instructions.

The program memory is composed as shown below.

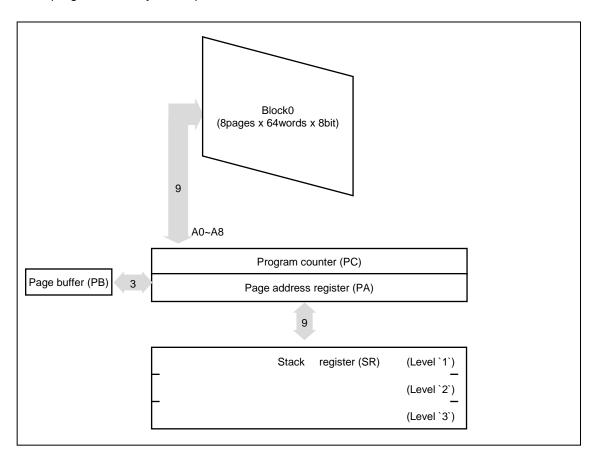

Fig 2-1 Configuration of Program Memory

2. Architecture ADAM24P165

2.2. Address Register

The following registers are used to address the ROM.

- Page address register (PA):
 Holds ROM's page number (0~7h) to be addressed.
- Page buffer register (PB):
 Value of PB is loaded by an LPBI command when newly addressing a page.

 Then it is shifted into the PA when rightly executing a branch instruction (BR) and a subroutine call (CAL).
- Program counter (PC):
 Available for addressing word on each page.
- Stack register (SR):
 Stores returned-word address in the subroutine call mode.

2.2.1. Page address register and page buffer register:

Address one of pages #0 to #7 in the ROM by the 3-bit binary counter. Unlike the program counter, the page address register is usually unchanged so that the program will repeat on the same page unless a page changing command is issued. To change the page address, take two steps such as

- (1) writing in the page buffer what page to jump (execution of LPBI) and
- (2) execution of BR or CAL, because instruction code is of eight bits so that page and word can not be specified at the same time.

In case a return instruction (RTN) is executed within the subroutine that has been called in the other page, the page address will be changed at the same time.

2.2.2. Program counter:

This 6-bit binary counter increments for each fetch to address a word in the currently addressed page having an instruction to be next executed. For easier programming, at turning on the power, the program counter is reset to the zero location. The PA is also set to `0`. Then the program counter specifies the next address in random sequence. When BR, CAL or RTN instructions are decoded, the switches on each step are turned off not to update the address. Then, for BR or CAL, address data are taken in from the instruction operands (a_0 to a_5), or for RTN, and address is fetched from stack register No. 1.

2.2.3. Stack register:

This stack register provides three stages each for the program counter (6bits) and the page address register (3bits) so that subroutine nesting can be made on three levels.

2.3. Data Memory (RAM)

Up to 16 nibbles (16 words \times 1pages \times 4bits) is incorporated for storing data. The whole data memory area is indirectly specified by a data pointer (X,Y). Page number is specified by zero bit of X register, and words in the page by 4 bits in Y-register. Data memory is composed in 16 nibbles/page. Figure 2-2 shows the configuration.

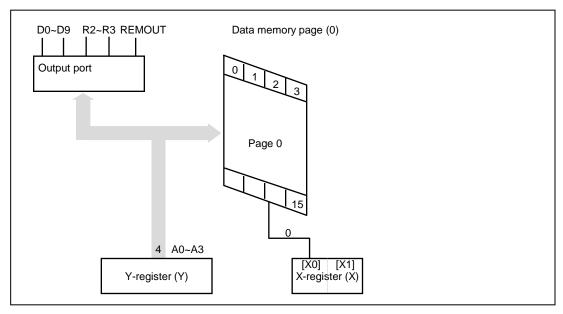

Fig 2-2 Composition of Data Memory

2.4. X-register (X)

X-register is consist of 2bit, X0 is not used, X1 is only used for selecting of D8 \sim D9 with value of Y-register

	X1 = 0	X1 = 1
Y = 0	D0	D8
Y = 1	D1	D9

Table2-1 Mapping table between X and Y register

2.5. Y-register (Y)

Y-register has 4 bits. It operates as a data pointer or a general-purpose register. Y-register specifies an address $(A_0 \sim A_3)$ in a page of data memory, as well as it is used to specify an output port. Further it is used to specify a mode of carrier signal outputted from the REMOUT port. It can also be treated as a general-purpose register on a program.

2.6. Accumulator (A_{CC})

The 4-bit register for holding data and calculation results.

2.7. Arithmetic and Logic Unit (ALU)

In this unit, 4bits of adder/comparator are connected in parallel as it's main components and they are combined with status latch and status logic (flag.)

2.7.1. Operation circuit (ALU):

The adder/comparator serves fundamentally for full addition and data comparison. It executes subtraction by making a complement by processing an inversed output of A_{CC} (A_{CC} +1)

2.7.2. Status logic:

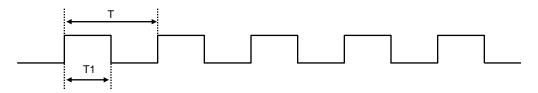

This is to bring an ST, or flag to control the flow of a program. It occurs when a specified instruction is executed in three cases such as overflow or underflow in operation and two inputs unequal.

2.8. Clock Generator

The ADAM24P16S has an internal RC oscillator which has 3.64MHz frequency only. The oscillator circuit is designed to operate without an external ceramic resonator. The Internal Oscillator is calibrate in Factory. In STOP mode, Internal oscillator is stopped.

2.9. Pulse Generator

The following frequency and duty ratio are selected for carrier signal outputted from the REMOUT port depending on a PMR (Pulse Mode Register) value set in a program.

PMR	REMOUT Signal				
0	T = 1/fpul = [96/fosc],	T1/T = 1/2			
1	T = 1/fpul = [96/fosc],	T1/T = 1/3			
2	T = 1/fpul = [64/fosc],	T1/T = 1/2			
3	T = 1/fpul = [64/fosc],	T1/T = 1/4			
4	T = 1/fpul = [88/fosc],	T1/T = 4/11			
5	No Pulse (same to D0~D9)				
6	T = 1/fpul = [96/fosc],	T1/T = 1/4			
7	T = 1/fpul = [92/fosc],	T1/T = 1/2			

^{*} Default value is `0`

Table 2-2 PMR selection table

2.10. Reset Operation

ADAM24P16S has three reset sources. One is a built-in Low VDD Detection circuit, another is the overflow of Watch Dog Timer (WDT), the other is the overflow of Stack. All reset operations are internal in the ADAM24P16S.

2.11. Built-in Low VDD Reset Circuit

ADAM24P16S has a Low VDD detection circuit.

If VDD becomes Reset Voltage of Low VDD detection circuit in a active status, system reset occur and WDT is cleared.

When VDD is increased over Reset Voltage again, WDT is re-counted until WDT overflow, system reset is released.

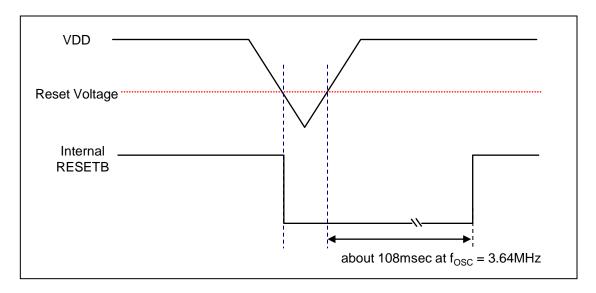

Fig 2-3 Low Voltage Detection Timing Chart.

2. Architecture ADAM24P165

2.12. Watch Dog Timer (WDT)

Watch dog timer is organized binary of 14 steps. The signal of $f_{\rm OSC}/48$ cycle comes in the first step of WDT after WDT reset. If this counter was overflowed, reset signal automatically comes out so that internal circuit is initialized.

The overflow time is $8\times6\times2^{13}/f_{OSC}$ (108.026ms at $f_{OSC}=3.64$ MHz) Normally, the binary counter must be reset before the overflow by using reset instruction (WDTR), Power-on reset pulse or Low VDD detection pulse.

* It is constantly reset in STOP mode. When STOP is released, counting is restarted. (Refer to 2.14. STOP Operation)

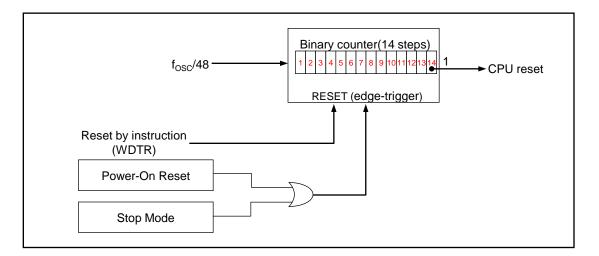

Fig 2-4 Block Diagram of Watch-dog Timer

2.13. STOP Operation

Stop mode can be achieved by STOP instructions.

In stop mode:

- 1. Oscillator is stopped, the operating current is low.
- 2. Watch dog timer is reset and REMOUT output is `High-Z`.
- 3. Part other than WDT and REMOUT output have a value before come into stop mode.
- 4. D0~D3 output are `Low` at STOP Mode.
- 5. D4~D9 output keep the status before STOP at STOP Mode.

Stop mode is released when one of K or R input is going to `Low`.

When stop mode released:

- 1. State of D0~D3 output and REMOUT output is return to state of before stop mode is achieved.
- 2. After $8 \times 6 \times 2^{10}$ /fosc time for stable oscillating, first instruction start to operate.
- 3. In return to normal operation, WDT is counted from zero.

When executing stop instruction, if any one of K,R input is `Low` state, stop instruction is same to NOP instruction.

2.14. Port Operation

Value of X - reg	Value of Y - reg	Operation
	0 ~ 7	SO : D(Y) ← 1 (High-Z) RO : D(Y) ← 0
	8	REMOUT port repeats `H` and `L` in pulse frequency. (When PMR=5, it is fixed at `H` or `L`) SO: REMOUT(PMR) ← 0 RO: REMOUT(PMR) ← 1 (High-Z)
0 or 1	9	SO : D0 ~ D9 ← 1 (High-Z) RO : D0 ~ D9 ← 0
	C~D	SO: R2(Y = C), R3(Y = D) \leftarrow 1 RO: R2(Y = C), R3(Y = D) \leftarrow 0
	E	SO: R2 ~ R3 ← 1 RO: R2 ~ R3 ← 0
	F	SO : D0 ~ D9 ← 1 (High-Z), R2~R3 ← 1 RO : D0 ~ D9 ← 0, R2~R3 ← 0
2 or 3	0	SO : D(8) ← 1 (High-Z) RO : D(8) ← 0
2 01 3	1	SO : D(9) ← 1 (High-Z) RO : D(9) ← 0

3. Instruction ADAM24P16S

3. INSTRUCTION

3.1. INSTRUCTION FORMAT

All of the 43 instruction in ADAM24P16S is format in two fields of OP code and operand which consist of eight bits. The following formats are available with different types of operands.

*Format |

All eight bits are for OP code without operand.

*Format II

Two bits are for operand and six bits for OP code.

Two bits of operand are used for specifying bits of RAM and X-register (bit 1 and bit 7 are fixed at "0")

*Format III

Four bits are for operand and the others are OP code.

Four bits of operand are used for specifying a constant loaded in RAM or Y-register, a comparison value of compare command, or page addressing in ROM.

*Format IV

Six bits are for operand and the others are OP code.

Six bits of operand are used for word addressing in the ROM.

3.2. INSTRUCTION TABLE

The ADAM24P16S provides the following 43 basic instructions.

	Category	Mnemonic	Function	ST*1
1		LAY	A ← Y	S
2	Register to Register	LYA	Y ← A	S
3	Register	LAZ	A ← 0	S
4		LMA	$M(X,Y) \leftarrow A$	S
5		LMAIY	$M(X,Y) \leftarrow A, Y \leftarrow Y+1$	S
6	RAM to Register	LYM	$Y \leftarrow M(X,Y)$	S
7	rtogiotoi	LAM	$A \leftarrow M(X,Y)$	S
8		XMA	$A \leftrightarrow M(X,Y)$	S
9		LYI i	Y ← i	S
10	Immediate	LMIIY i	$M(X,Y) \leftarrow i, Y \leftarrow Y+1$	S
11		LXI n	X ← n	S
12		SEM n	M(n) ← 1	S
13	RAM Bit Manipulation	REM n	$M(n) \leftarrow 0$	S
14		TM n	TEST M(n) = 1	E
15		BR a	if ST = 1 then Branch	S
16		CAL a	if ST = 1 then Subroutine call	S
17	ROM	RTN	Return from Subroutine	S
18	Address	LPBI i	PB ←i	S
19		LBBY *	BB ←Y	S
20		LDWAY	AY ← [@XAY]	S
21		AM	$A \leftarrow M(X,Y) + A$	С
22		SM	$A \leftarrow M(X,Y) - A$	В
23		IM	$A \leftarrow M(X,Y) + 1$	С
24	Arithmetic	DM	$A \leftarrow M(X,Y) - 1$	В
25		IA	A ← A + 1	S
26		IY	Y ← Y + 1	С
27		DA	A ← A - 1	В

^{*} LBBY instruction is not available in ADAM24P16S.

	Category	Mnemonic	Function	ST*1
28		DY	Y ← Y - 1	В
29	Arithmetic	EORM	$A \leftarrow A \bigoplus M (X,Y)$	S
30		NEGA	$A \leftarrow \overline{A} + 1$	Z
31		ALEM	TEST A \leq M(X,Y)	E
32		ALEI i	TEST A ≤ i	Ш
33		MNEZ	TEST M(X,Y) ≠ 0	N
34	Comparison	YNEA	TEST Y ≠ A	N
35		YNEI i	TEST Y ≠ i	N
36		LAK	A ← K	S
37	Input / Output	LAR	A ← R	S
38	σαιραί	so	Output(Y) $\leftarrow 1^{*2}$	S
39		RO	Output(Y) ← 0*2	S
40		WDTR	Watch Dog Timer Reset	S
41	Control	STOP	Stop operation	S
42	Control	LPY	PMR ← Y	S
43		NOP	No operation	S

Note) $i = 0 \sim f$, $n = 0 \sim 3$, a = 6bit PC Address

- S: On executing an instruction, status is unconditionally set.
- C: Status is only set when carry or borrow has occurred in operation.
- B: Status is only set when borrow has not occurred in operation.
- E : Status is only set when equality is found in comparison.
- N: Status is only set when equality is not found in comparison.
- Z : Status is only set when the result is zero.

^{*1} Column ST indicates conditions for changing status. Symbols have the following meanings

^{*2} Refer to 2.14. Port Operation.

ADAM24P16S 3. Instruction

3.3. DETAILS OF INSTRUCTION SYSTEM

All 43 basic instructions of the ADAM24P16S are one by one described in detail below.

Description Form

Each instruction is headlined with its mnemonic symbol according to the instructions table given earlier.

Then, for quick reference, it is described with basic items as shown below. After that, detailed comment follows.

• Items :

- Naming : Full spelling of mnemonic symbol

- Status : Check of status function - Format : Categorized into | to |V - Operand : Omitted for Format |

- Function

3. Instruction ADAM24P165

(1) LAY

Naming: Load Accumulator from Y-Register

Status : Set Format : I Function : $A \leftarrow Y$

<Comment> Data of four bits in the Y-register is unconditionally transferred

to the accumulator. Data in the Y-register is left unchanged.

(2) LYA

Naming: Load Y-register from Accumulator

 $\begin{array}{lll} \text{Status}: & \text{Set} \\ \text{Format}: & \text{I} \\ \text{Function}: & \text{Y} \leftarrow \text{A} \end{array}$

<Comment> Load Y-register from Accumulator

(3) LAZ

Naming: Clear Accumulator

 $\begin{array}{lll} \text{Status:} & \text{Set} \\ \text{Format:} & \text{I} \\ \text{Function:} & \text{A} \leftarrow 0 \end{array}$

<Comment> Data in the accumulator is unconditionally reset to zero.

(4) LMA

Naming: Load Memory from Accumulator

Status : Set Format : I

Function: $M(X,Y) \leftarrow A$

<Comment> Data of four bits from the accumulator is stored in the RAM

location addressed by the X-register and Y-register. Such

data is left unchanged.

(5) LMAIY

Naming: Load Memory from Accumulator and Increment Y-Register

Status : Set Format : I

Function: $M(X,Y) \leftarrow A, Y \leftarrow Y+1$

<Comment> Data of four bits from the accumulator is stored in the RAM

location addressed by the X-register and Y-register. Such

data is left unchanged.

ADAM24P16S

(6) LYM

Naming: Load Y-Register form Memory

Status : Set Format : I

Function: $Y \leftarrow M(X,Y)$

Comment> Data from the RAM location addressed by the X-register and

Y-register is loaded into the Y-register. Data in the memory is

left unchanged.

(7) LAM

Naming: Load Accumulator from Memory

Status: Set Format: I

Function: $A \leftarrow M(X,Y)$

<Comment> Data from the RAM location addressed by the X-register and

Y-register is loaded into the Y-register. Data in the memory is

left unchanged.

(8) XMA

Naming: Exchanged Memory and Accumulator

Status: Set Format: I

Function: $M(X,Y) \leftrightarrow A$

Comment> Data from the memory addressed by X-register and Y-register

is exchanged with data from the accumulator. For example, this instruction is useful to fetch a memory word into the accumulator for operation and store current data from the accumulator into the RAM. The accumulator can be restored

by another XMA instruction.

(9) LYI i

Naming: Load Y-Register from Immediate

Status: Set Format: III

Operand: Constant $0 \le i \le 15$

Function: $Y \leftarrow i$

<Purpose> To load a constant in Y-register. It is typically used to specify

Y-register in a particular RAM word address, to specify the address of a selected output line, to set Y-register for specifying a carrier signal outputted from OUT port, and to initialize Y-register for loop control. The accumulator can be

restored by another XMA instruction.

<Comment> Data of four bits from operand of instruction is transferred to

the Y-register.

3. Instruction ADAM24P16S

(10) LMIIY i

Naming: Load Memory from Immediate and Increment Y-Register

Status: Set Format: III

Operand : Constant $0 \le i \le 15$ Function : $M(X,Y) \leftarrow i, Y \leftarrow Y + 1$

<Comment> Data of four bits from operand of instruction is stored into the

RAM location addressed by the X-register and Y-register.

Then data in the Y-register is incremented by one.

(11) LXI n

Naming: Load X-Register from Immediate

Status: Set Format:

Operand: X file address $0 \le n \le 3$

Function: $X \leftarrow n$

<Comment> A constant is loaded in X-register. It is used to set X-register in

an index of desired RAM page. Operand of 1 bit of command

is loaded in X-register.

(12) SEM n

Naming: Set Memory Bit

Status : Set Format :

Operand: Bit address $0 \le n \le 3$ Function: $M(X,Y,n) \leftarrow 1$

<Comment> Depending on the selection in operand of operand, one of four

bits is set as logic 1 in the RAM memory addressed in accordance with the data of the X-register and Y-register.

(13) REM n

Naming: Reset Memory Bit

Status: Set Format:

Operand : Bit address $0 \le n \le 3$ Function : $M(X,Y,n) \leftarrow 0$

<Comment> Depending on the selection in operand of operand, one of four

bits is set as logic 0 in the RAM memory addressed in accordance with the data of the X-register and Y-register.

ADAM24P16S 3. Instruction

(14) TM n

Naming: Test Memory Bit

Status: Comparison results to status

Format:

Operand: Bit address $0 \le n \le 3$ Function: $M(X,Y,n) \leftarrow 1$?

 $ST \leftarrow 1 \text{ when } M(X,Y,n)=1, ST \leftarrow 0 \text{ when } M(X,Y,n)=0$

<Purpose> A test is made to find if the selected memory bit is logic. 1

Status is set depending on the result.

(15) BR a

Naming: Branch on status 1

Status: Conditional depending on the status

Format: IV

Operand: Branch address a (Addr)

Function: When ST =1: BA \leftarrow BB, PA \leftarrow PB, PC \leftarrow a (Addr)

When ST = 0 : PC \leftarrow PC + 1, ST \leftarrow 1

Note: PC indicates the next address in a fixed sequence that

is actually pseudo-random count.

<Purpose> For some programs, normal sequential program execution

can be change.

A branch is conditionally implemented depending on the status of results obtained by executing the previous

instruction.

<Comment> Branch instruction is always conditional depending on the status.

a. If the status is reset (logic 0), a branch instruction is not rightly executed but the next instruction of the sequence is executed.

b. If the status is set (logic 1), a branch instruction is executed as follows.

Branch is available in two types - short and long. The former

Branch is available in two types - short and long. The former is for addressing in the current page and the latter for

addressing in other block/page.

Which type of branch to execute is decided according to the BB and PB register. To execute a long branch, data of the BB or PB register should in advance be modified to a desired block/page address through the

LBBY or LPBI instruction.

3. Instruction ADAM24P165

(16) CAL a

Naming: Subroutine Call on status 1

Status: Conditional depending on the status

Format:

Operand: Subroutine code address a (Addr)

Function: When ST = 1:

When ST = 0:

 $PC \leftarrow PC + 1$ $PA \leftarrow PA$ $BA \leftarrow BA$ $ST \leftarrow 1$

Note: PC actually has pseudo-random count against the next instruction.

<Comment> In a program, control is allowed to be transferred to a mutual

subroutine. Since a call instruction preserves the return address, it is possible to call the subroutine from different locations in a program, and the subroutine can return control accurately to the address that is preserved by the use of the

call return instruction (RTN).

Such calling is always conditional depending on the status.

a. If the status is reset, call is not executed.

b. If the status is set, call is rightly executed.

The subroutine stack (SR) of three levels enables a subroutine to be manipulated on three levels. Besides, a long call (to call another page) can be executed on any level.

For a long call, LBBY or LPBI instruction should be executed before the CAL. When LBBY or LPBI is omitted (and when BA=BB and PA=PB), a short call (calling in the same page) is executed.

(17) RTN

Naming: Return from Subroutine

Status: Set Format:

Function: $PC \leftarrow SR1$ $PA, PB \leftarrow PSR1$ PSR1 PSR2 PSR3 PSR3 PSR3 PSR3

ST ← 1

<Purpose> program. <Comment>

Control is returned from the called subroutine to the calling

Control is returned to its home routine by transferring to the

PC the data of the return address that has been saved in the stack

register (SR1).

At the same time, data of the page stack register (PSR1) is

transferred to the PA and PB, and data of the block stack register(BSR1)

is transferred to the BA and BB.

(18) LPBI i

Naming: Load Page Buffer Register from Immediate

Status : Set Format : III

Operand: ROM page address $0 \le i \le 15$

Function: $PB \leftarrow i$

<Purpose> A new ROM page address is loaded into the page buffer

register (PB).

This loading is necessary for a long branch or call instruction.

The PB register is loaded together with three bits from 4 bit

operand.

(19) LBBY

Naming: Load Block Buffer Register from Y-register.

Status : Set Format : I

<Comment>

Function: $BB \leftarrow Y$

<Purpose> A new ROM page address is loaded into the block buffer

register (BB).

This loading is necessary for a long branch or call instruction.

The BB register is loaded two bits (V[1:0]) in the V-register.

Comment> The BB register is loaded two bits(Y[1:0]) in the Y-register.

Data in the Y-register is left unchanged.

(20) LDWAY

Naming: Load Word from ROM addressed by XAY-register.

Status: Set Format: I

Function:

 $SR1 \leftarrow PC + 1$ $PSR1 \leftarrow PA$ $BSR1 \leftarrow BA$ $SR2 \leftarrow SR1$ $PSR2 \leftarrow PSR1$ $BSR2 \leftarrow BSR1$ $SR3 \leftarrow SR2$ $PSR3 \leftarrow PSR2$ $BSR3 \leftarrow BSR2$

 $PA,PC \leftarrow XAY(Addr)$

 $AY \leftarrow [@XAY]$

 $A \leftarrow MSB \text{ 4-Bit of } [@XAY]$ Y \leftarrow LSB 4-Bit of [@XAY]

<Purpose> Data transfer from ROM to AY-register.

Comment> The A register is loaded higher four bits in the ROM,

and the Y register is loaded lower four bits in the ROM.

3. Instruction ADAM24P165

(21) AM

Naming: Add Accumulator to Memory and Status 1 on Carry

Status: Carry to status

Format:

Function: $A \leftarrow M(X,Y) + A$ $ST \leftarrow 1$ (when total>15),

 $ST \leftarrow 0$ (when total ≤ 15)

<Comment> Data in the memory location addressed by the X and Y-register

is added to data of the accumulator. Results are stored in the accumulator. Carry data as results is transferred to status. When the total is more than 15, a carry is caused to put "1"

in the status. Data in the memory is not changed.

(22) SM

Naming: Subtract Accumulator to Memory and Status 1 Not Borrow

Status: Carry to status

Format:

Function: $A \leftarrow M(X,Y) - A$ $ST \leftarrow 1(when A \le M(X,Y))$

 $ST \leftarrow 0$ (when A > M(X,Y))

<Comment> Data of the accumulator is, through a 2's complement

addition, subtracted from the memory word addressed by the Y-register. Results are stored in the accumulator. If data of the accumulator is less than or equal to the memory word, the

status is set to indicate that a borrow is not caused.

If more than the memory word, a borrow occurs to reset the

status to "0".

(23) IM

Naming: Increment Memory and Status 1 on Carry

Status: Carry to status

Format:

Function: A \leftarrow M(X,Y) + 1 ST \leftarrow 1(when M(X,Y) \geq 15)

 $ST \leftarrow 0$ (when M(X,Y) < 15)

<Comment> Data of the memory addressed by the X and Y-register is

fetched. Adding 1 to this word, results are stored in the accumulator. Carry data as results is transferred to the status. When the total is more than 15, the status is set. The memory

is left unchanged.

(24) DM

Naming: Decrement Memory and Status 1 on Not Borrow

Status: Carry to status

Format:

Function: $A \leftarrow M(X,Y) - 1$ $ST \leftarrow 1 \text{ (when } M(X,Y) \ge 1)$

 $ST \leftarrow 0$ (when M(X,Y) = 0)

Comment> Data of the memory addressed by the X and Y-register is

fetched, and one is subtracted from this word (addition of Fh). Results are stored in the accumulator. Carry data as results is transferred to the status. If the data is more than or equal to one, the status is set to indicate that no borrow is caused. The

memory is left unchanged.

I*DAM24P16S*

(25) IA

Naming: Increment Accumulator

Status: Set Format:

Function: $A \leftarrow A+1$

<Comment> Data of the accumulator is incremented by one. Results are

returned to the accumulator.

A carry is not allowed to have effect upon the status.

(26) IY

Increment Y-Register and Status 1 on Carry Naming:

Status: Carry to status

Format:

 $Y \leftarrow Y + 1$ Function: $ST \leftarrow 1 \text{ (when Y = 15)}$

 $ST \leftarrow 0$ (when Y < 15)

Data of the Y-register is incremented by one and results are <Comment>

returned to the Y-register.

Carry data as results is transferred to the status. When the

total is more than 15, the status is set.

(27) DA

Naming: Decrement Accumulator and Status 1 on Borrow

Status: Carry to status

Format:

 $ST \leftarrow 1 \text{ (when A } \geq 1\text{)}$ Function: $A \leftarrow A - 1$

 $ST \leftarrow 0 \text{ (when A = 0)}$

<Comment> Data of the accumulator is decremented by one. As a result

(by addition of Fh), if a borrow is caused, the status is reset to

"0" by logic. If the data is more than one, no borrow occurs

and thus the status is set to "1".

3. Instruction ADAM24P165

(28) DY

Naming: Decrement Y-Register and Status 1 on Not Borrow

Status: Carry to status

Format:

Function: $Y \leftarrow Y - 1$ $ST \leftarrow 1 \text{ (when } Y \ge 1)$

 $ST \leftarrow 0 \text{ (when } Y = 0)$

<Purpose> Data of the Y-register is decremented by one.

<Comment> Data of the Y-register is decremented by one by addition of

minus 1 (Fh).

Carry data as results is transferred to the status. When the results is equal to 15, the status is set to indicate that no

borrow has not occurred.

(29) **EORM**

Naming: Exclusive or Memory and Accumulator

Status: Set Format:

Function: $A \leftarrow M(X,Y) \oplus A$

Comment> Data of the accumulator is, through a Exclusive OR,

subtracted from the memory word addressed by X and Y-

register. Results are stored into the accumulator.

(30) **NEGA**

Naming: Negate Accumulator and Status 1 on Zero

Status: Carry to status

Format:

Function: $A \leftarrow \overline{A} + 1$ $ST \leftarrow 1 \text{ (when A = 0)}$

 $ST \leftarrow 0 \text{ (when A != 0)}$

<Purpose> The 2's complement of a word in the accumulator is obtained.
<Comment> The 2's complement in the accumulator is calculated by adding

one to the 1's complement in the accumulator. Results are stored into the accumulator. Carry data is transferred to the status. When data of the accumulator is zero, a carry is

caused to set the status to "1".

ADAM24P16S 3. Instruction

(31) ALEM

Naming: Accumulator Less Equal Memory

Status : Carry to status

Format:

Function : $A \le M(X,Y)$ $ST \leftarrow 1 \text{ (when } A \le M(X,Y))$

 $ST \leftarrow 0 \text{ (when A > M(X,Y))}$

<Comment> Data of the accumulator is, through a complement addition,

subtracted from data in the memory location addressed by the X and Y-register. Carry data obtained is transferred to the status. When the status is "1", it indicates that the data of the accumulator is less than or equal to the data of the memory word. Neither of those data is not changed.

(32) ALEI

Naming: Accumulator Less Equal Immediate

Status: Carry to status

Format :

Function: $A \le i$ $ST \leftarrow 1 \text{ (when } A \le i)$

 $ST \leftarrow 0 \text{ (when A > i)}$

<Purpose> Data of the accumulator and the constant are arithmetically

compared.

Comment> Data of the accumulator is, through a complement addition,

subtracted from the constant that exists in 4bit operand.

Carry data obtained is transferred to the status.

The status is set when the accumulator value is less than or

equal to the constant. Data of the accumulator is left

unchanged.

(33) MNEZ

Naming: Memory Not Equal Zero
Status: Comparison results to status

Format:

Function: $M(X,Y) \neq 0$ $ST \leftarrow 1(when M(X,Y) \neq 0)$

 $ST \leftarrow 0 \text{ (when } M(X,Y) = 0)$

<Purpose> A memory word is compared with zero.

Comment> Data in the memory addressed by the X and Y-register is

logically compared with zero. Comparison data is

transferred to the status. Unless it is zero, the status is set.

3. Instruction ADAM24P16S

(34) YNEA

Naming: Y-Register Not Equal Accumulator Status: Comparison results to status

Format:

Function: $Y \neq A$ $ST \leftarrow 1$ (when $Y \neq A$)

 $ST \leftarrow 0 \text{ (when } Y = A)$

<Purpose> Data of Y-register and accumulator are compared to check if

they are not equal.

<Comment> Data of the Y-register and accumulator are logically

compared.

Results are transferred to the status. Unless they are equal,

the status is set.

(35) YNEI

Naming : Y-Register Not Equal Immediate Status : Comparison results to status

Format:

Operand: Constant $0 \le i \le 15$

Function: $Y \neq i$ ST $\leftarrow 1$ (when $Y \neq i$)

 $ST \leftarrow 0 \text{ (when } Y = i)$

Comment> The constant of the Y-register is logically compared with 4bit

operand. Results are transferred to the status. Unless the

operand is equal to the constant, the status is set.

(36) LAK

Naming: Load Accumulator from K

 $\begin{array}{lll} \text{Status:} & \text{Set} \\ \text{Format:} & \text{I} \\ \text{Function:} & \text{A} \leftarrow \text{K} \end{array}$

<Comment> Data on K are transferred to the accumulator

(37) LAR

Naming: Load Accumulator from R

 $\begin{array}{lll} \text{Status}: & \text{Set} \\ \text{Format}: & | \\ \text{Function}: & \text{A} \leftarrow \text{R} \end{array}$

<Comment> Data on R are transferred to the accumulator

ADAM24P16S

(38) SO

Naming: Set Output Register Latch

Status : Set Format :

Function: $D(Y) \leftarrow 1$ $0 \le Y \le 7$

 $\begin{tabular}{lll} REMOUT \leftarrow 1 (PMR=5) & Y = 8 \\ D0 \sim D9 \leftarrow 1 & (High-Z) & Y = 9 \\ R(Y) \leftarrow 1 & Ch \leq Y \leq Dh \\ R(Y) \leftarrow 1 & Y = Eh \\ D0 \sim D9, R2 \sim R3 \leftarrow 1 & Y = Fh \\ \end{tabular}$

<Purpose> A single D output line is set to logic 1, if data of Y-register is

between 0 to 7.

Carrier frequency come out from REMOUT port, if data of

Y-register is 8.

All D output line is set to logic 1, if data of Y-register is 9.

When Y is between Ch and Dh, one of R2 and R3 is set to logic 1.

When Y is Eh, R2 and R3 is set to logic 1.

When Y is Fh, All D output and R2 and R3 is set to logic 1.

<Comment> Data of Y-register is between 0 to 7, selects appropriate D output.

Data of Y-register is 8, selects REMOUT port. Data of Y-register is 9, selects all D port.

Data in Y-register, when between Ch and Dh, selects an appropriate R port.

Data in Y-register, when it is Eh, selects all of R2~R3.

Data in Y-register, when it is Fh, selects all of D0~D9 and R2~R3.

(38) RO

Naming: Set Output Register Latch

Status: Set Format:

Function: $D(Y) \leftarrow 0$ $0 \le Y \le 7$

REMOUT \leftarrow 0(PMR=5) Y = 8D0 \sim D9 \leftarrow 0 Y = 9R(Y) \leftarrow 0 $Ch \leq Y \leq Dh$ R(Y) \leftarrow 0 Y = EhD0 \sim D9,R2 \sim R3 \leftarrow 0 Y = Fh

<Purpose> A single D output line is set to logic 0, if data of Y-register is

between 0 to 7.

REMOUT port is set to logic 0, if data of Y-register is 8. All D output line is set to logic 0, if data of Y-register is 9.

When Y is between Ch and Dh, one of R2 and R3 is set to logic 0.

When Y is Eh, R2 and R3 is set to logic 0.

When Y is Fh, All D output and R2 and R3 is set to logic 0.

<Comment> Data of Y-register is between 0 to 7, selects appropriate D output.

Data of Y-register is 8, selects REMOUT port.

Data of Y-register is 9, selects all D port.

Data in Y-register, when between Ch and Dh, selects an appropriate R port.

Data in Y-register, when it is Eh, selects all of R2~R3.

Data in Y-register, when it is Fh, selects all of D0~D9 and R2~R3.

3. Instruction ADAM24P16S

(40) WDTR

Naming: Watch Dog Timer Reset

Status : Set Format :

Function: Reset Watch Dog Timer (WDT)

<Purpose> Normally, you should reset this counter before overflowed

counter for dc watch dog timer. this instruction controls this

reset signal.

(41) STOP

Naming: STOP Status: Set Format:

Function : Operate the stop function

<Purpose> Stopped oscillator, and little current.

(42) LPY

Naming: Pulse Mode Set

Status : Set Format :

Function: $PMR \leftarrow Y$

<Comment> Selects a pulse signal outputted from REMOUT port.

(43) NOP

Naming: No Operation

Status: Set Format:

Function: No operation

ADAM24P16S

3.4. Guideline for S/W

- (1) All rams need to be initialized to any value in reset address for proper design.
- (2) Make the output ports `High` after reset.
- (3) Do not use WDTR instruction in subroutine.
- (4) When you try to read input port changed from external condition, you must secure chattering time more than 200uS.
- (5) To decrease current consumption, make the output port as high in normal routine except for key scan strobe and STOP mode.
- (6) We recommend you do not use all 64 ROM bytes in a page.
 It's recommend to add `BR \$` at first and last address of each page.
 Do not add `BR \$` at reset address which is first address of `00` page of `0` bank.
- (7) `NOP` instruction should be follows STOP instruction for pre-charge time of Data Bus line. ex) STOP: STOP instruction execution

NOP : NOP instruction
